Petrophysical Evaluation Reservoirs and Seals

HELMAN BONILLA / LUIS VERGARA

RESERVOIR EVALUATION

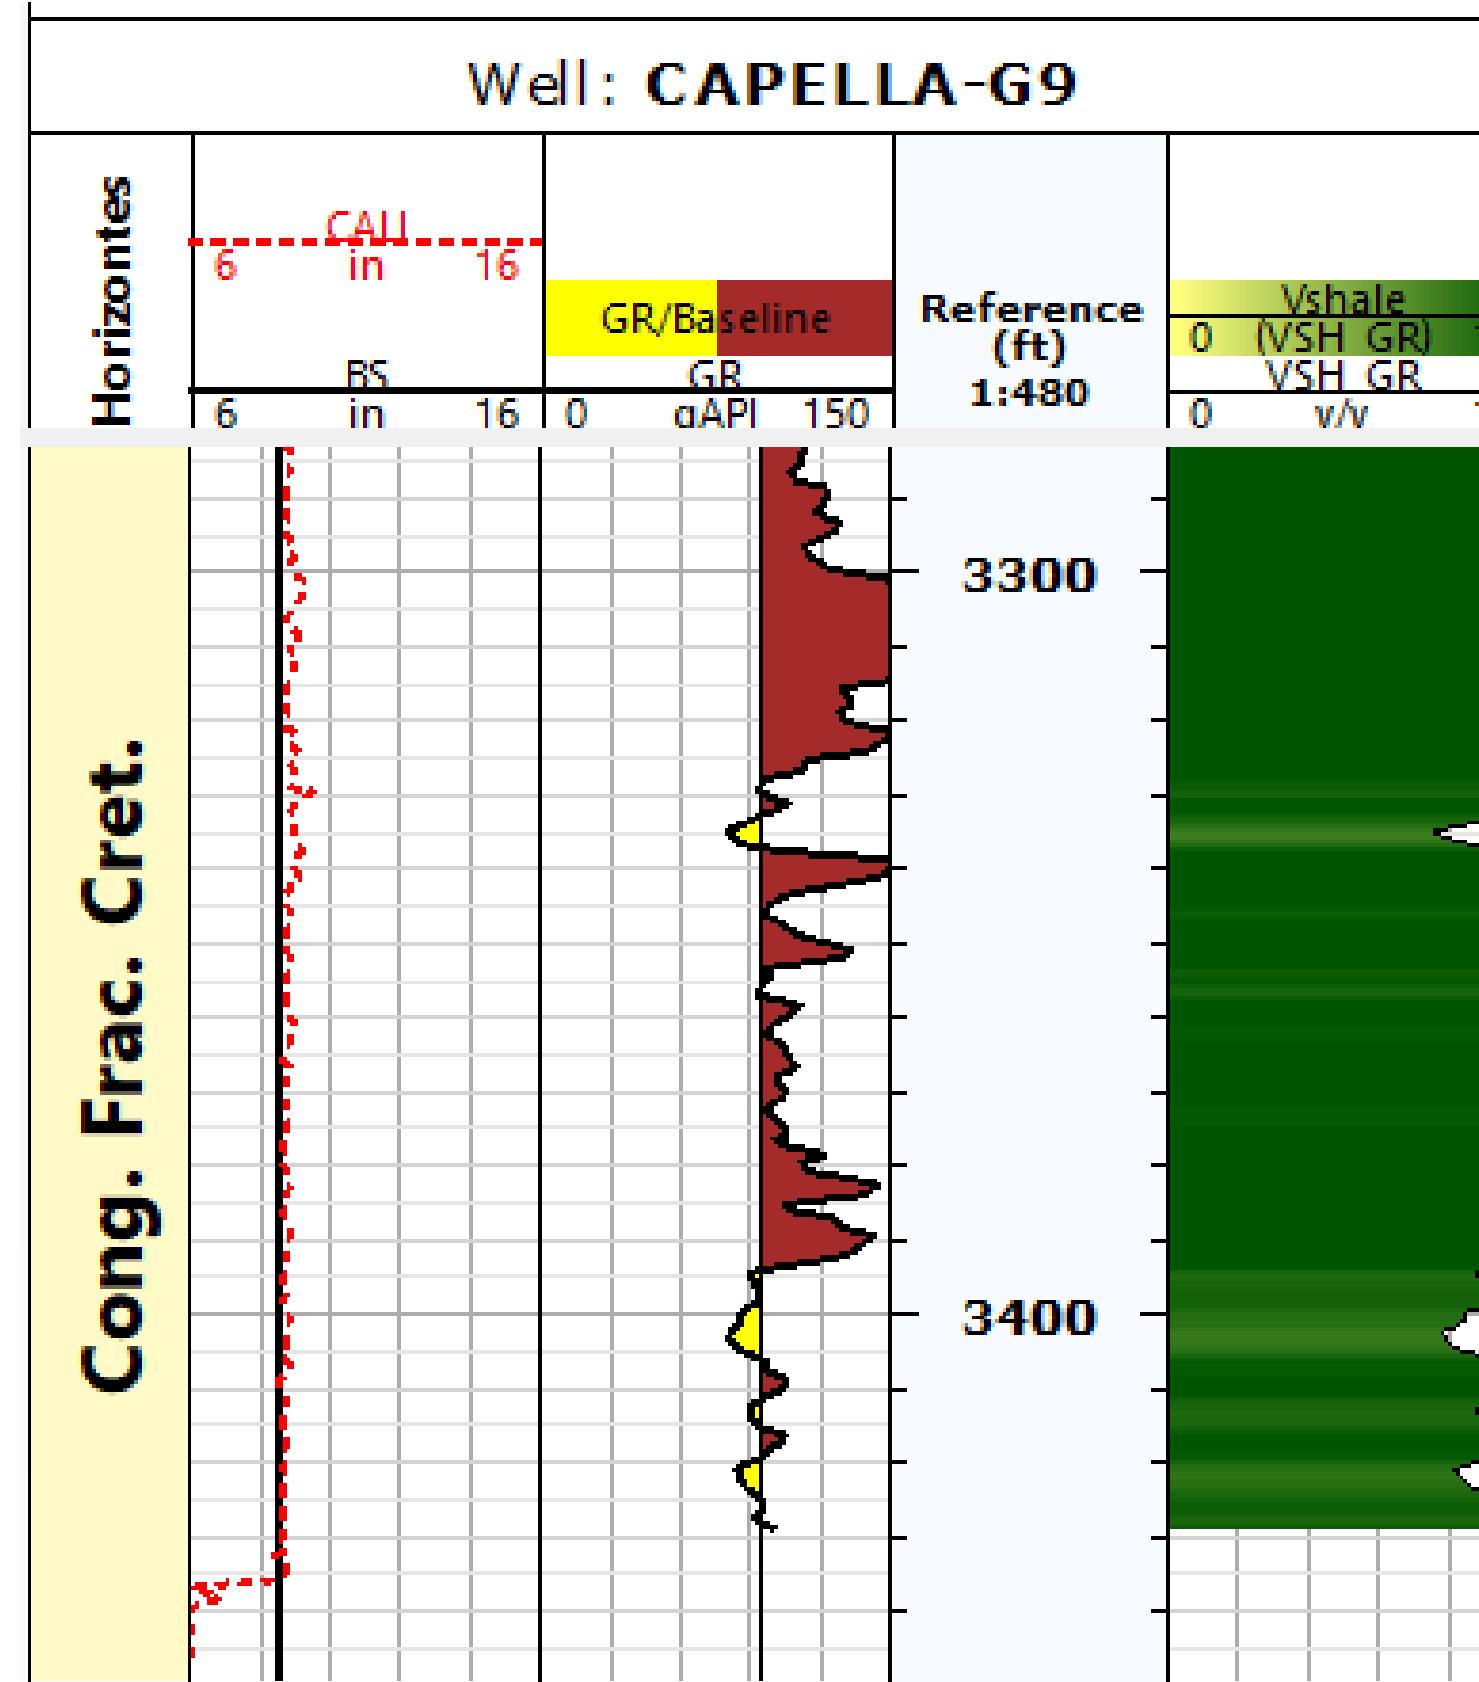

Masaya Formation

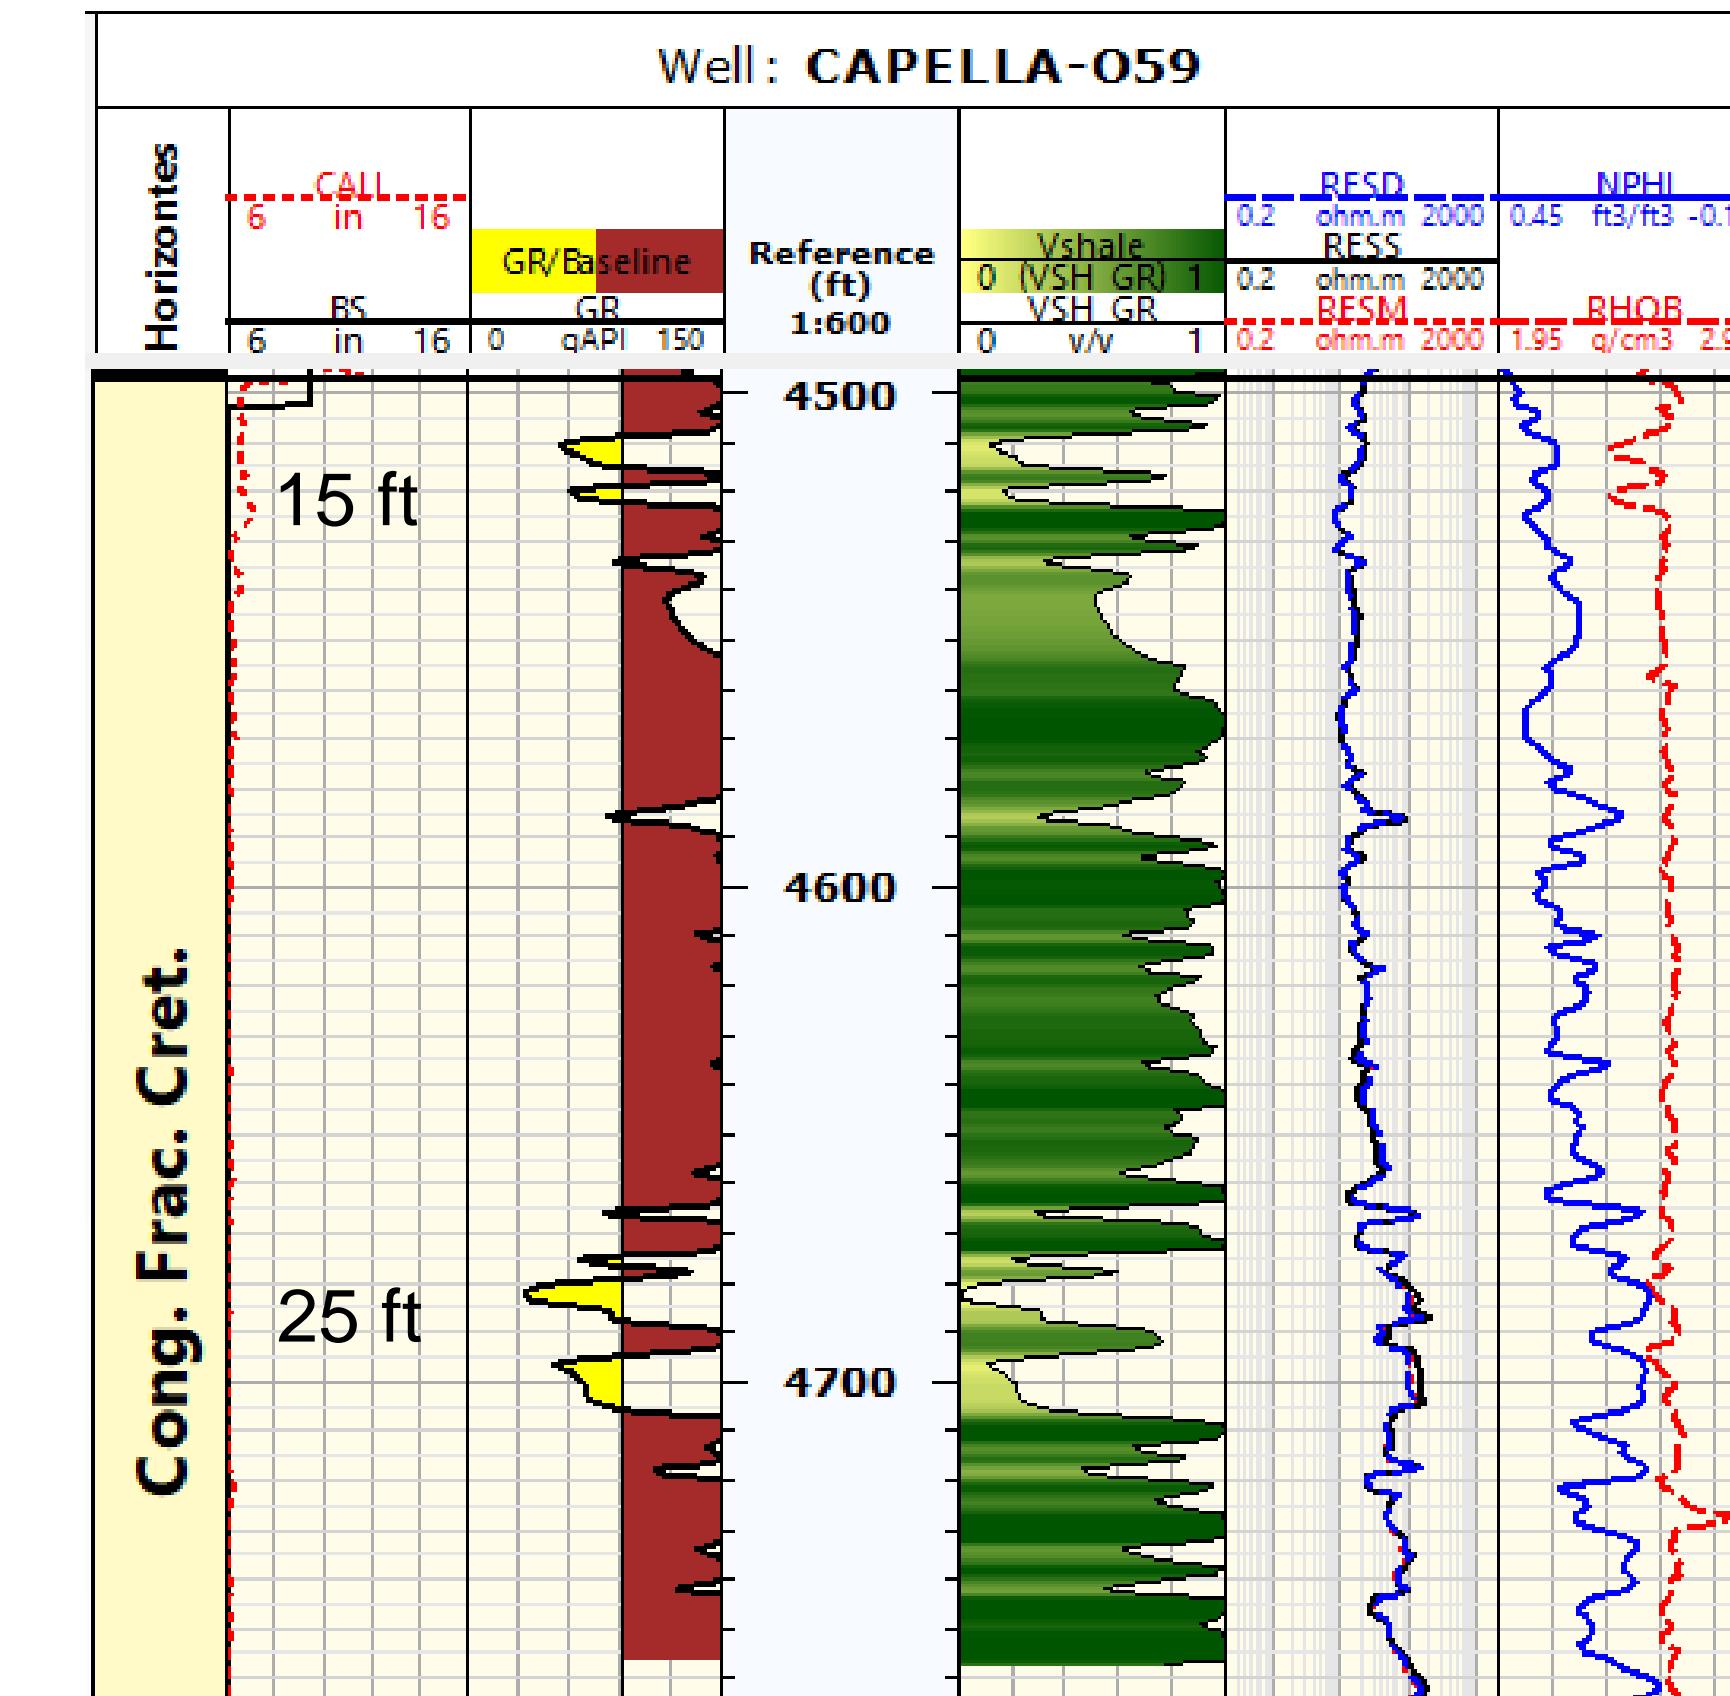

- Clay zones towards the top, otherwise clean sandstones with GR 30-70 API and Vclay of 10% average.
- High resistivity with possible fluid mobility
- Low Permeabilities of about 2 mD.
- Oil shows and favorable lithology indicate potential storage capacity

RESERVOIR EVALUATION

“Fractured Conglomerate”

- Conglomerates with sandstone interbeds, 150 ft thick
- Main components are quartz fragments, pebbles, igneous and metamorphic lithics
 - Presence of fractures may affect porosity calculations, up to 25% Ø possible

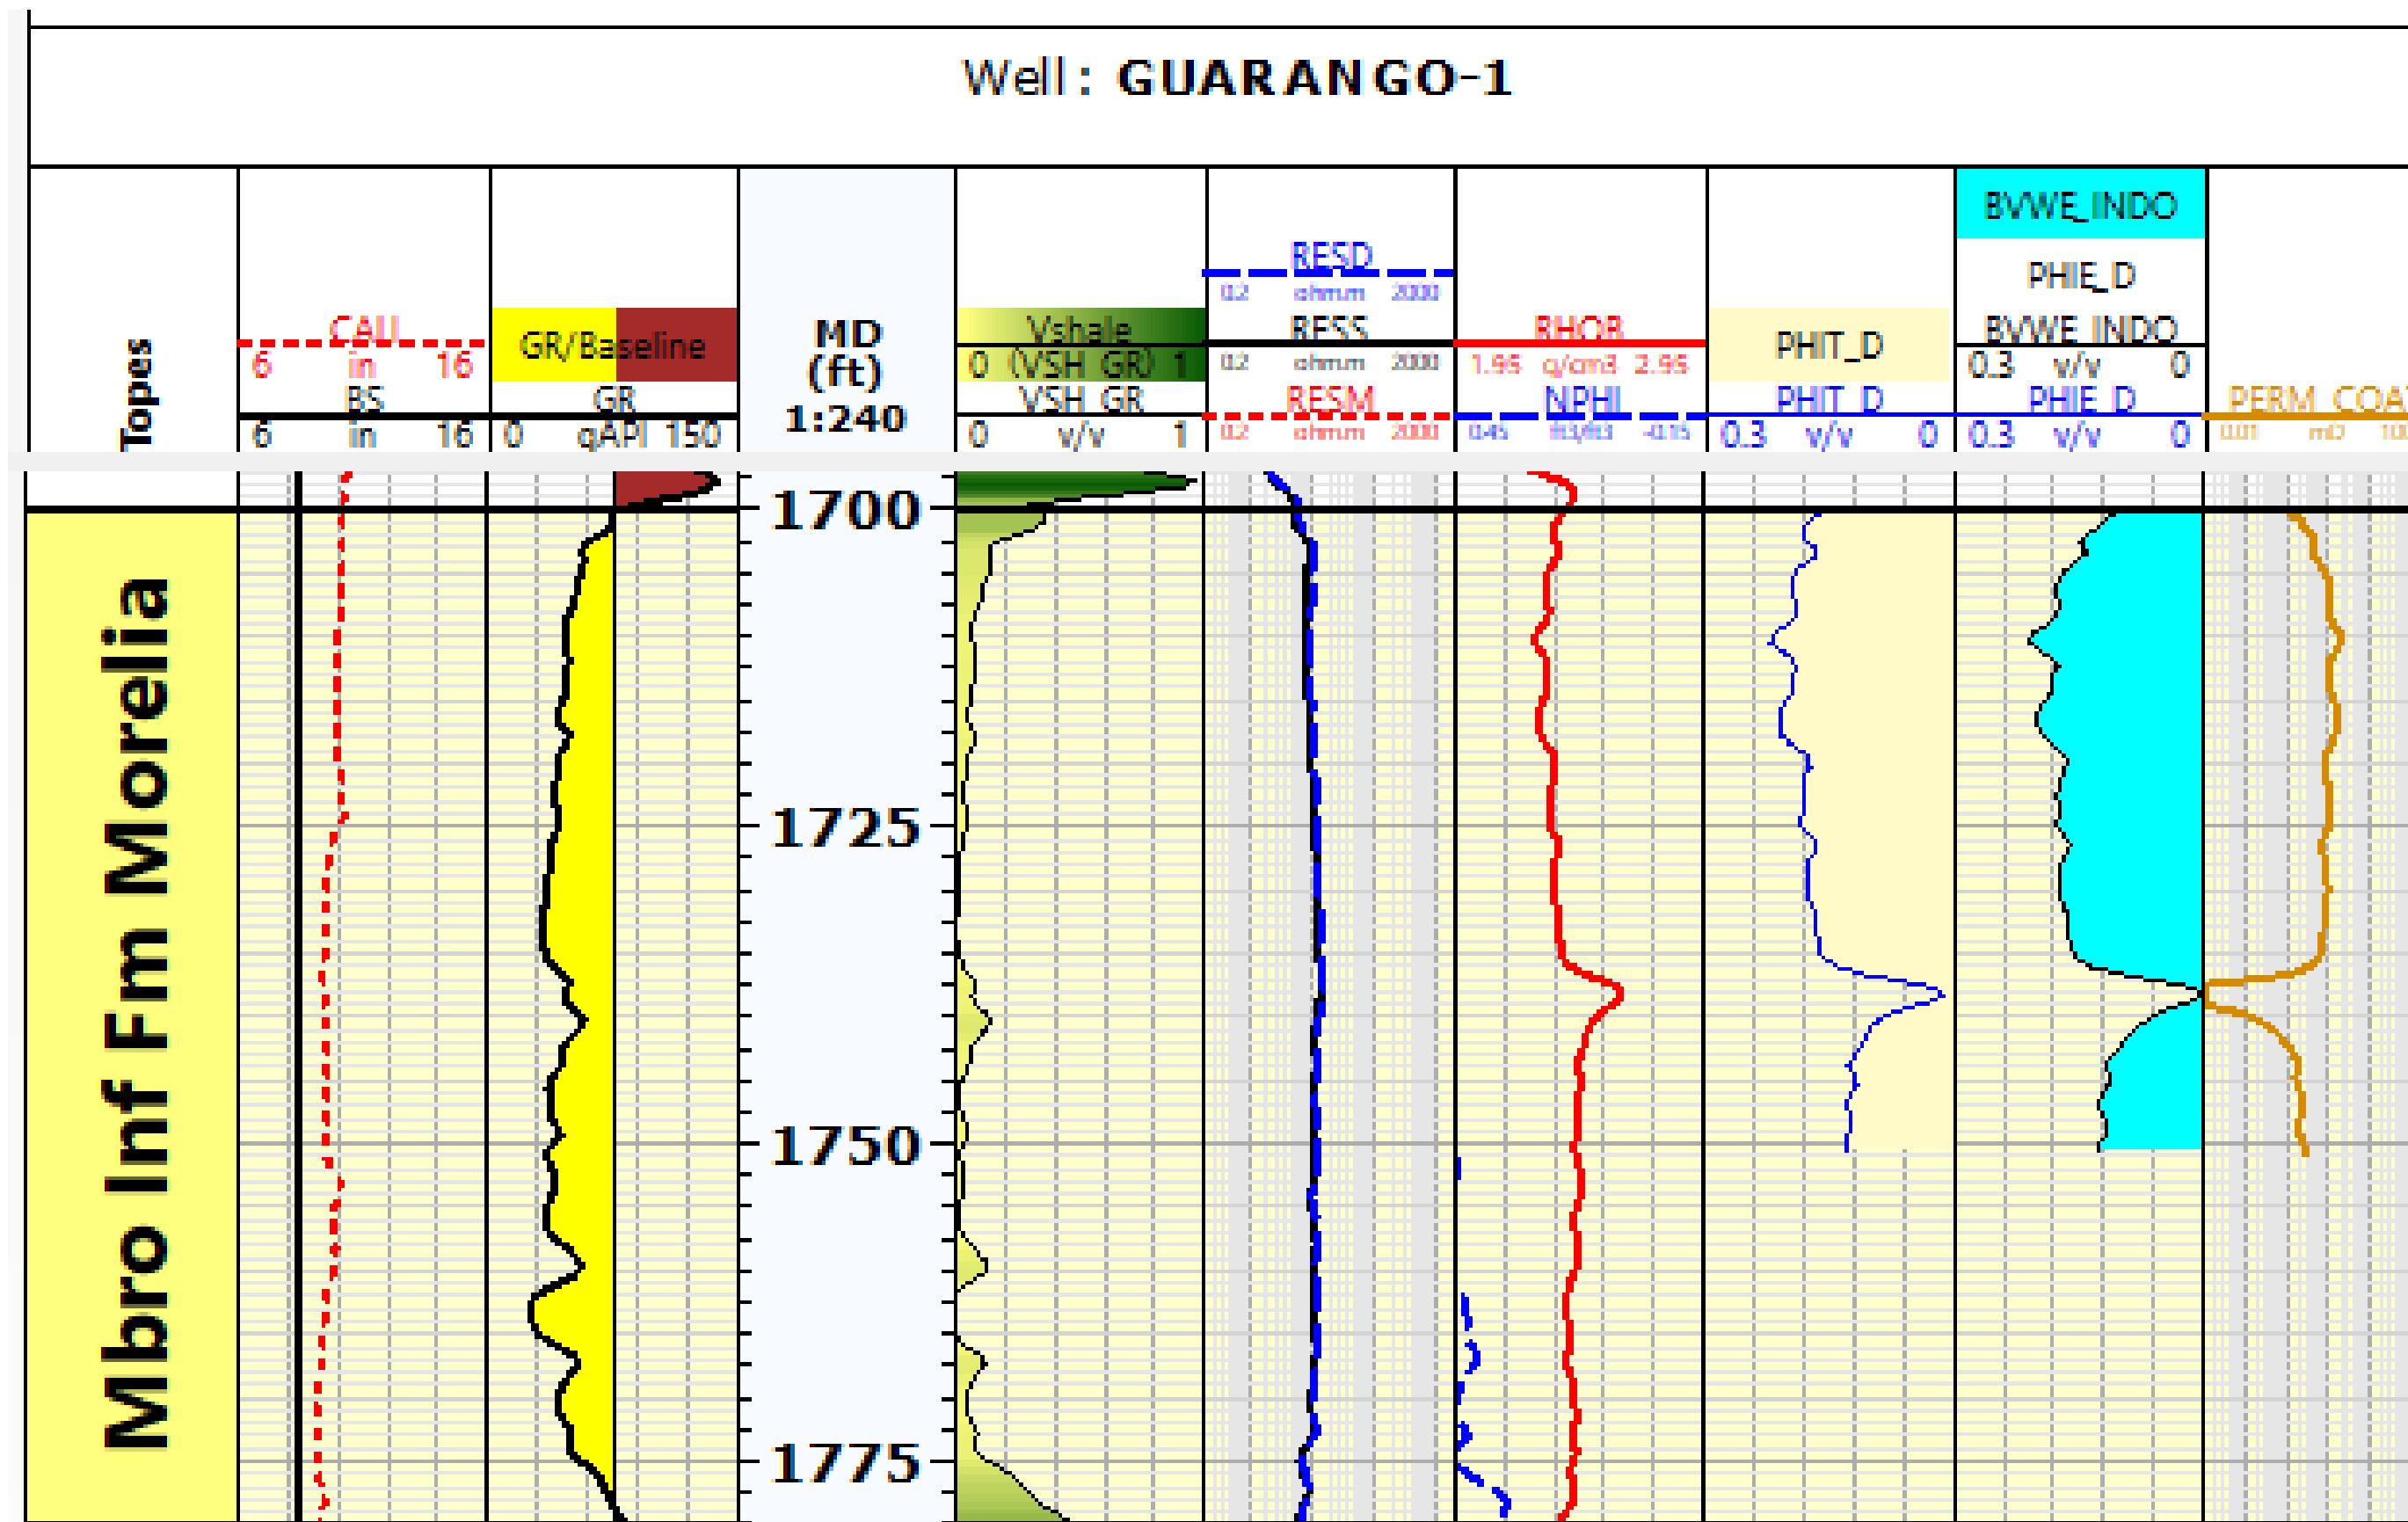

- Predominantly clay interval 100 ft thick
- Sandy zones with GR 55-70 API and Vclay ~ 12-18% have reservoir potential

RESERVOIR EVALUATION

Lower Morelia Formation

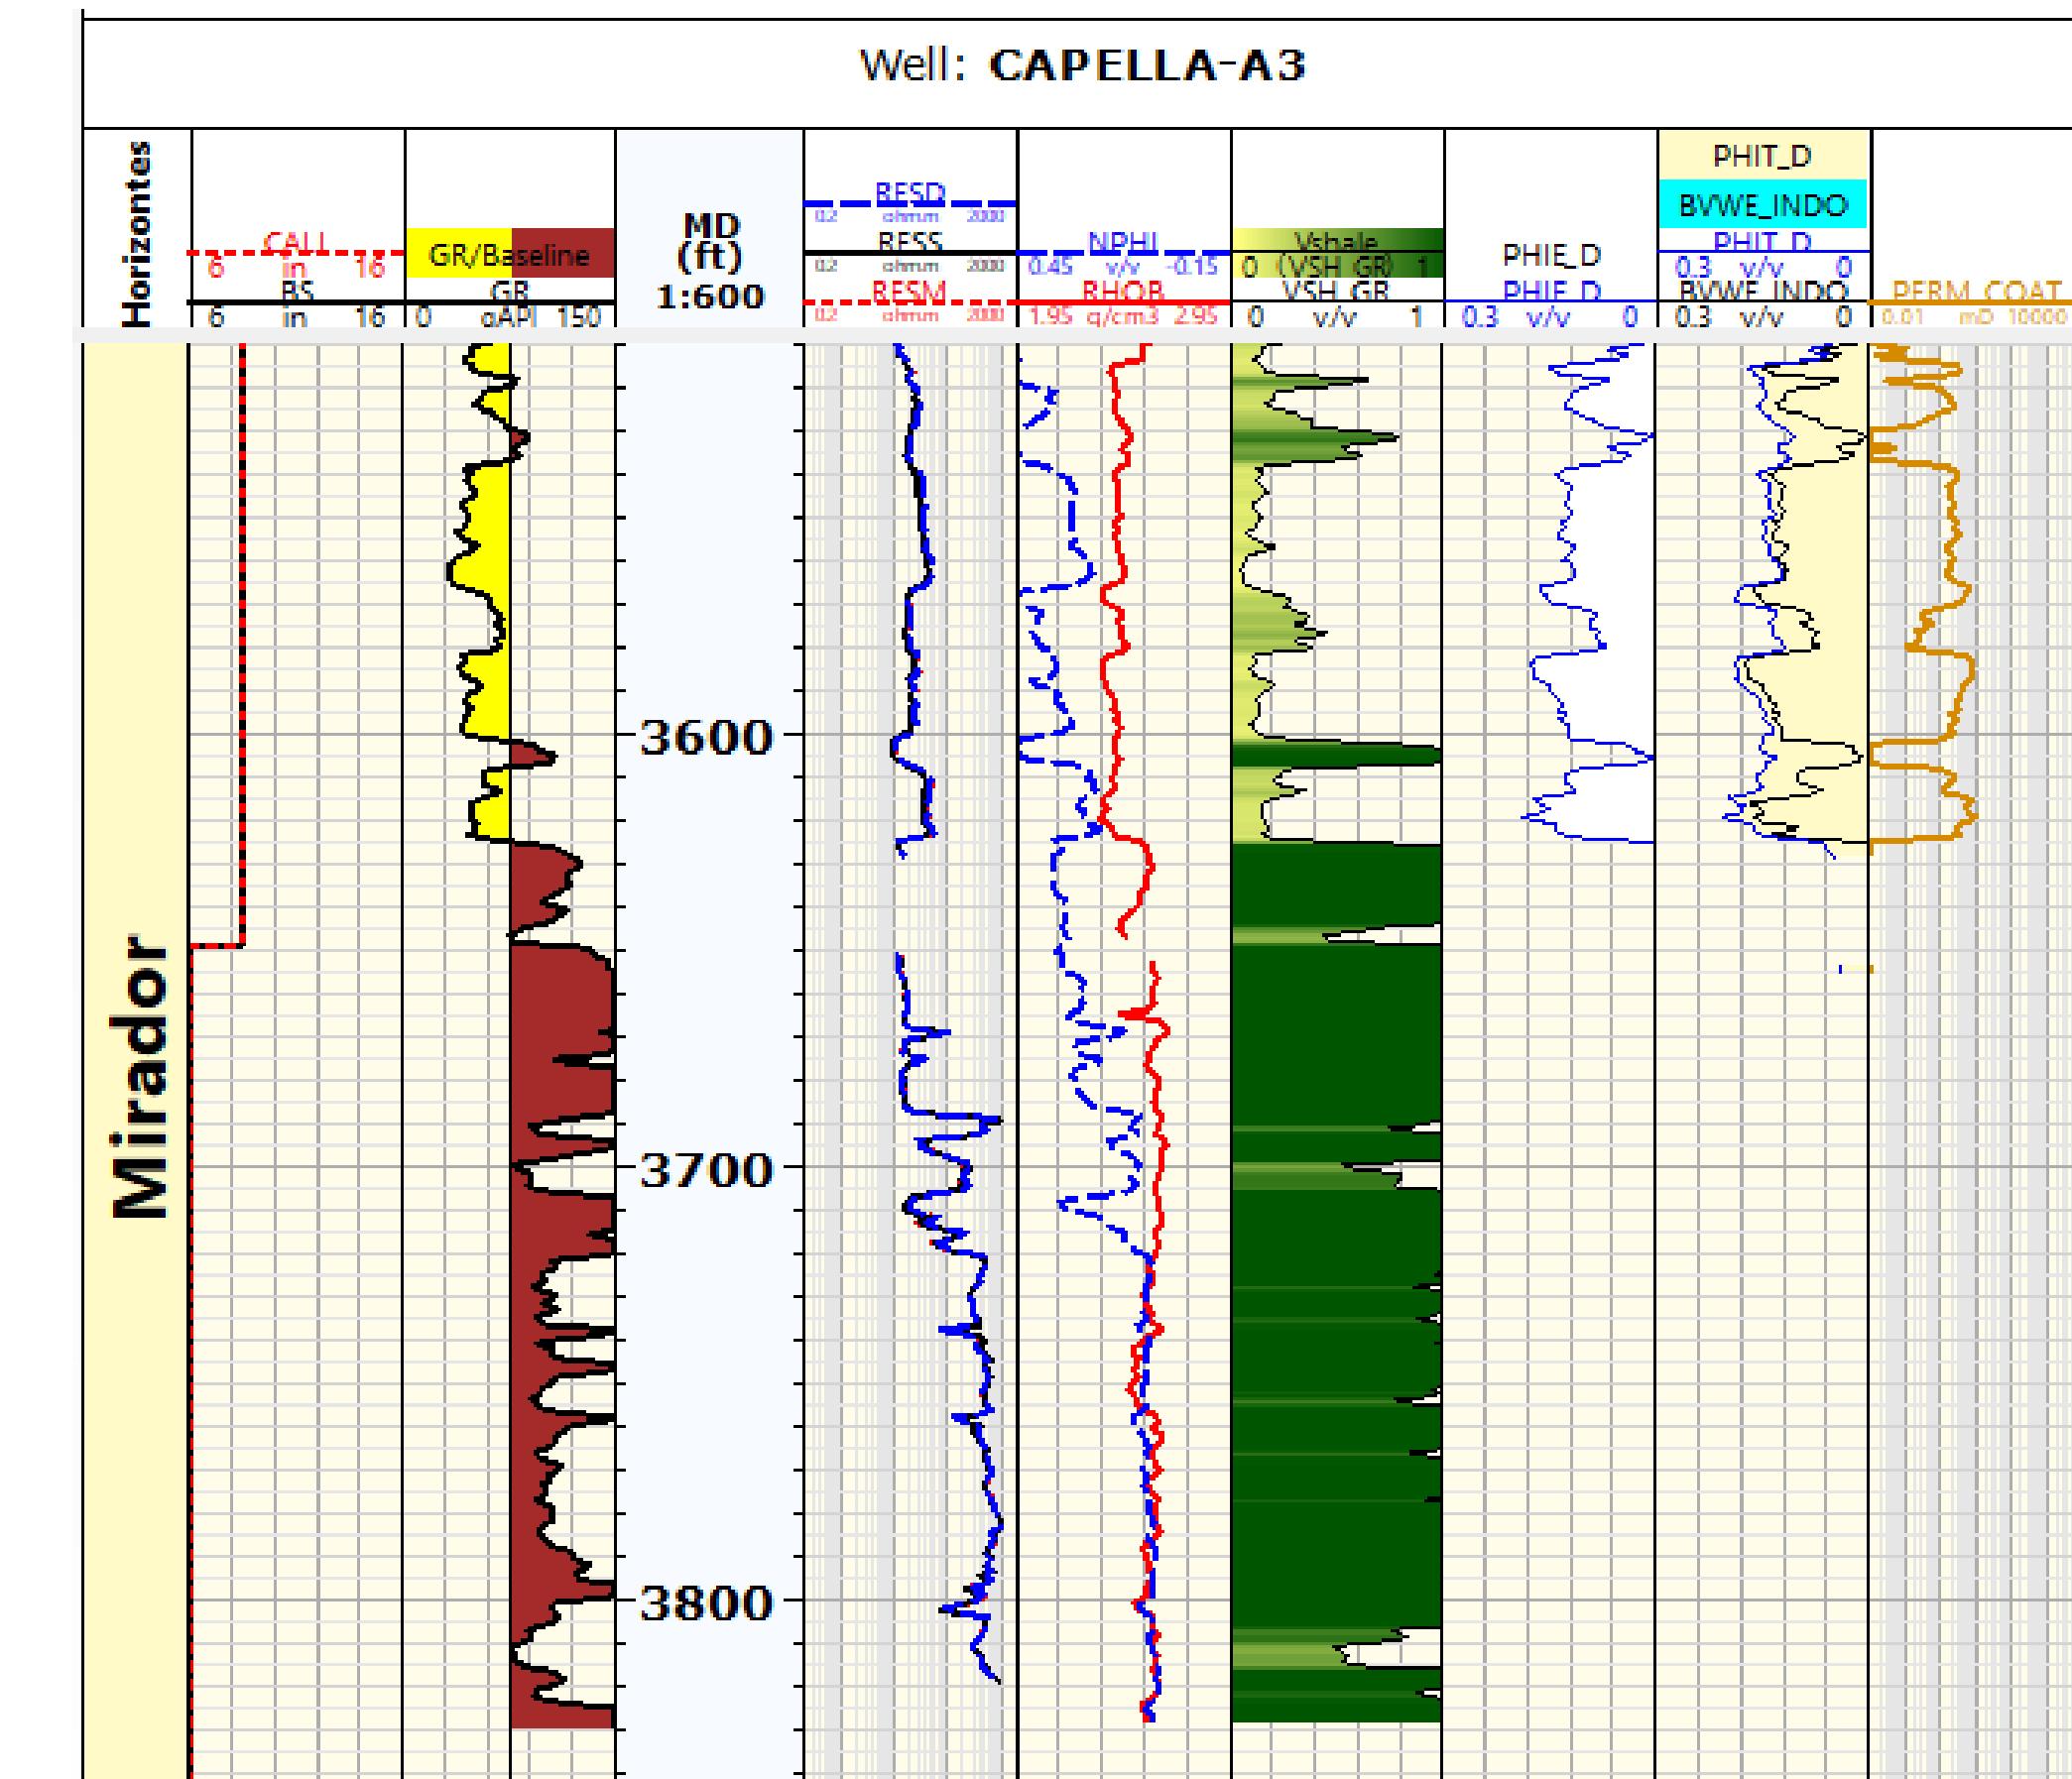

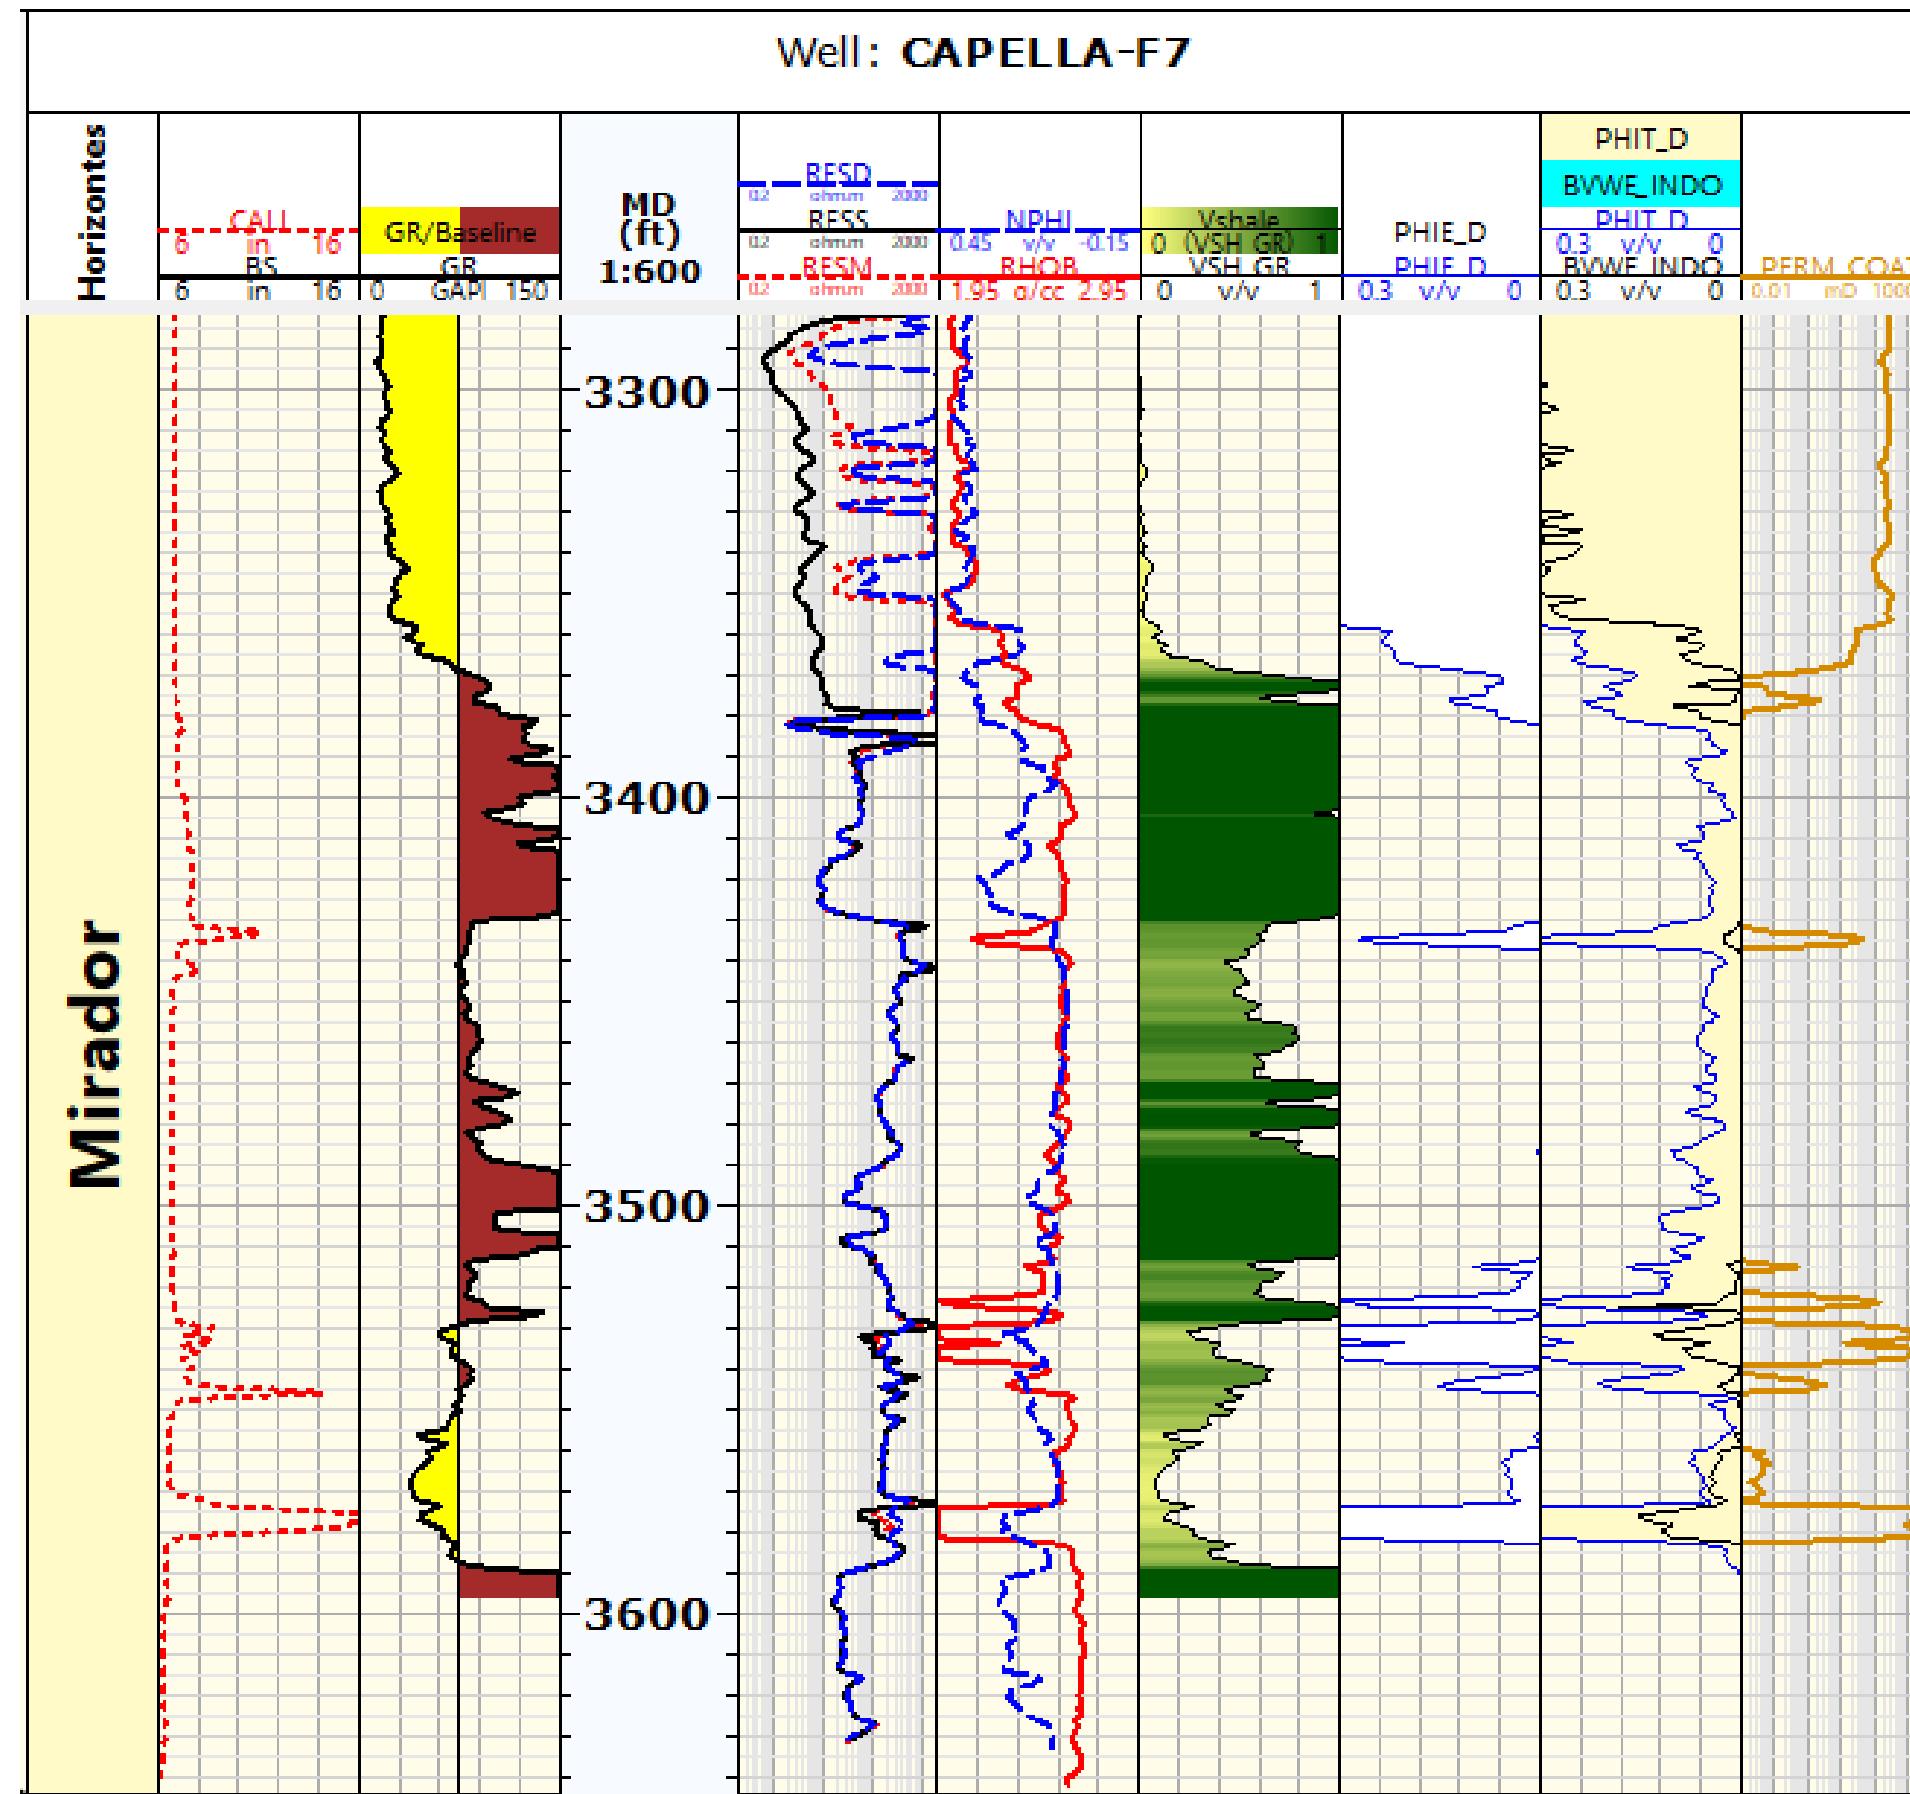

("Basal Sandstones ")

- Clean lithology
- GR values 30 - 70 API
- Vclay < 10%
- Low resistivity values and deflection indicate poor mobilities
- Average Porosity 16%
- Low Permeability 8 mD.

RESERVOIR EVALUATION

Mirador Formation

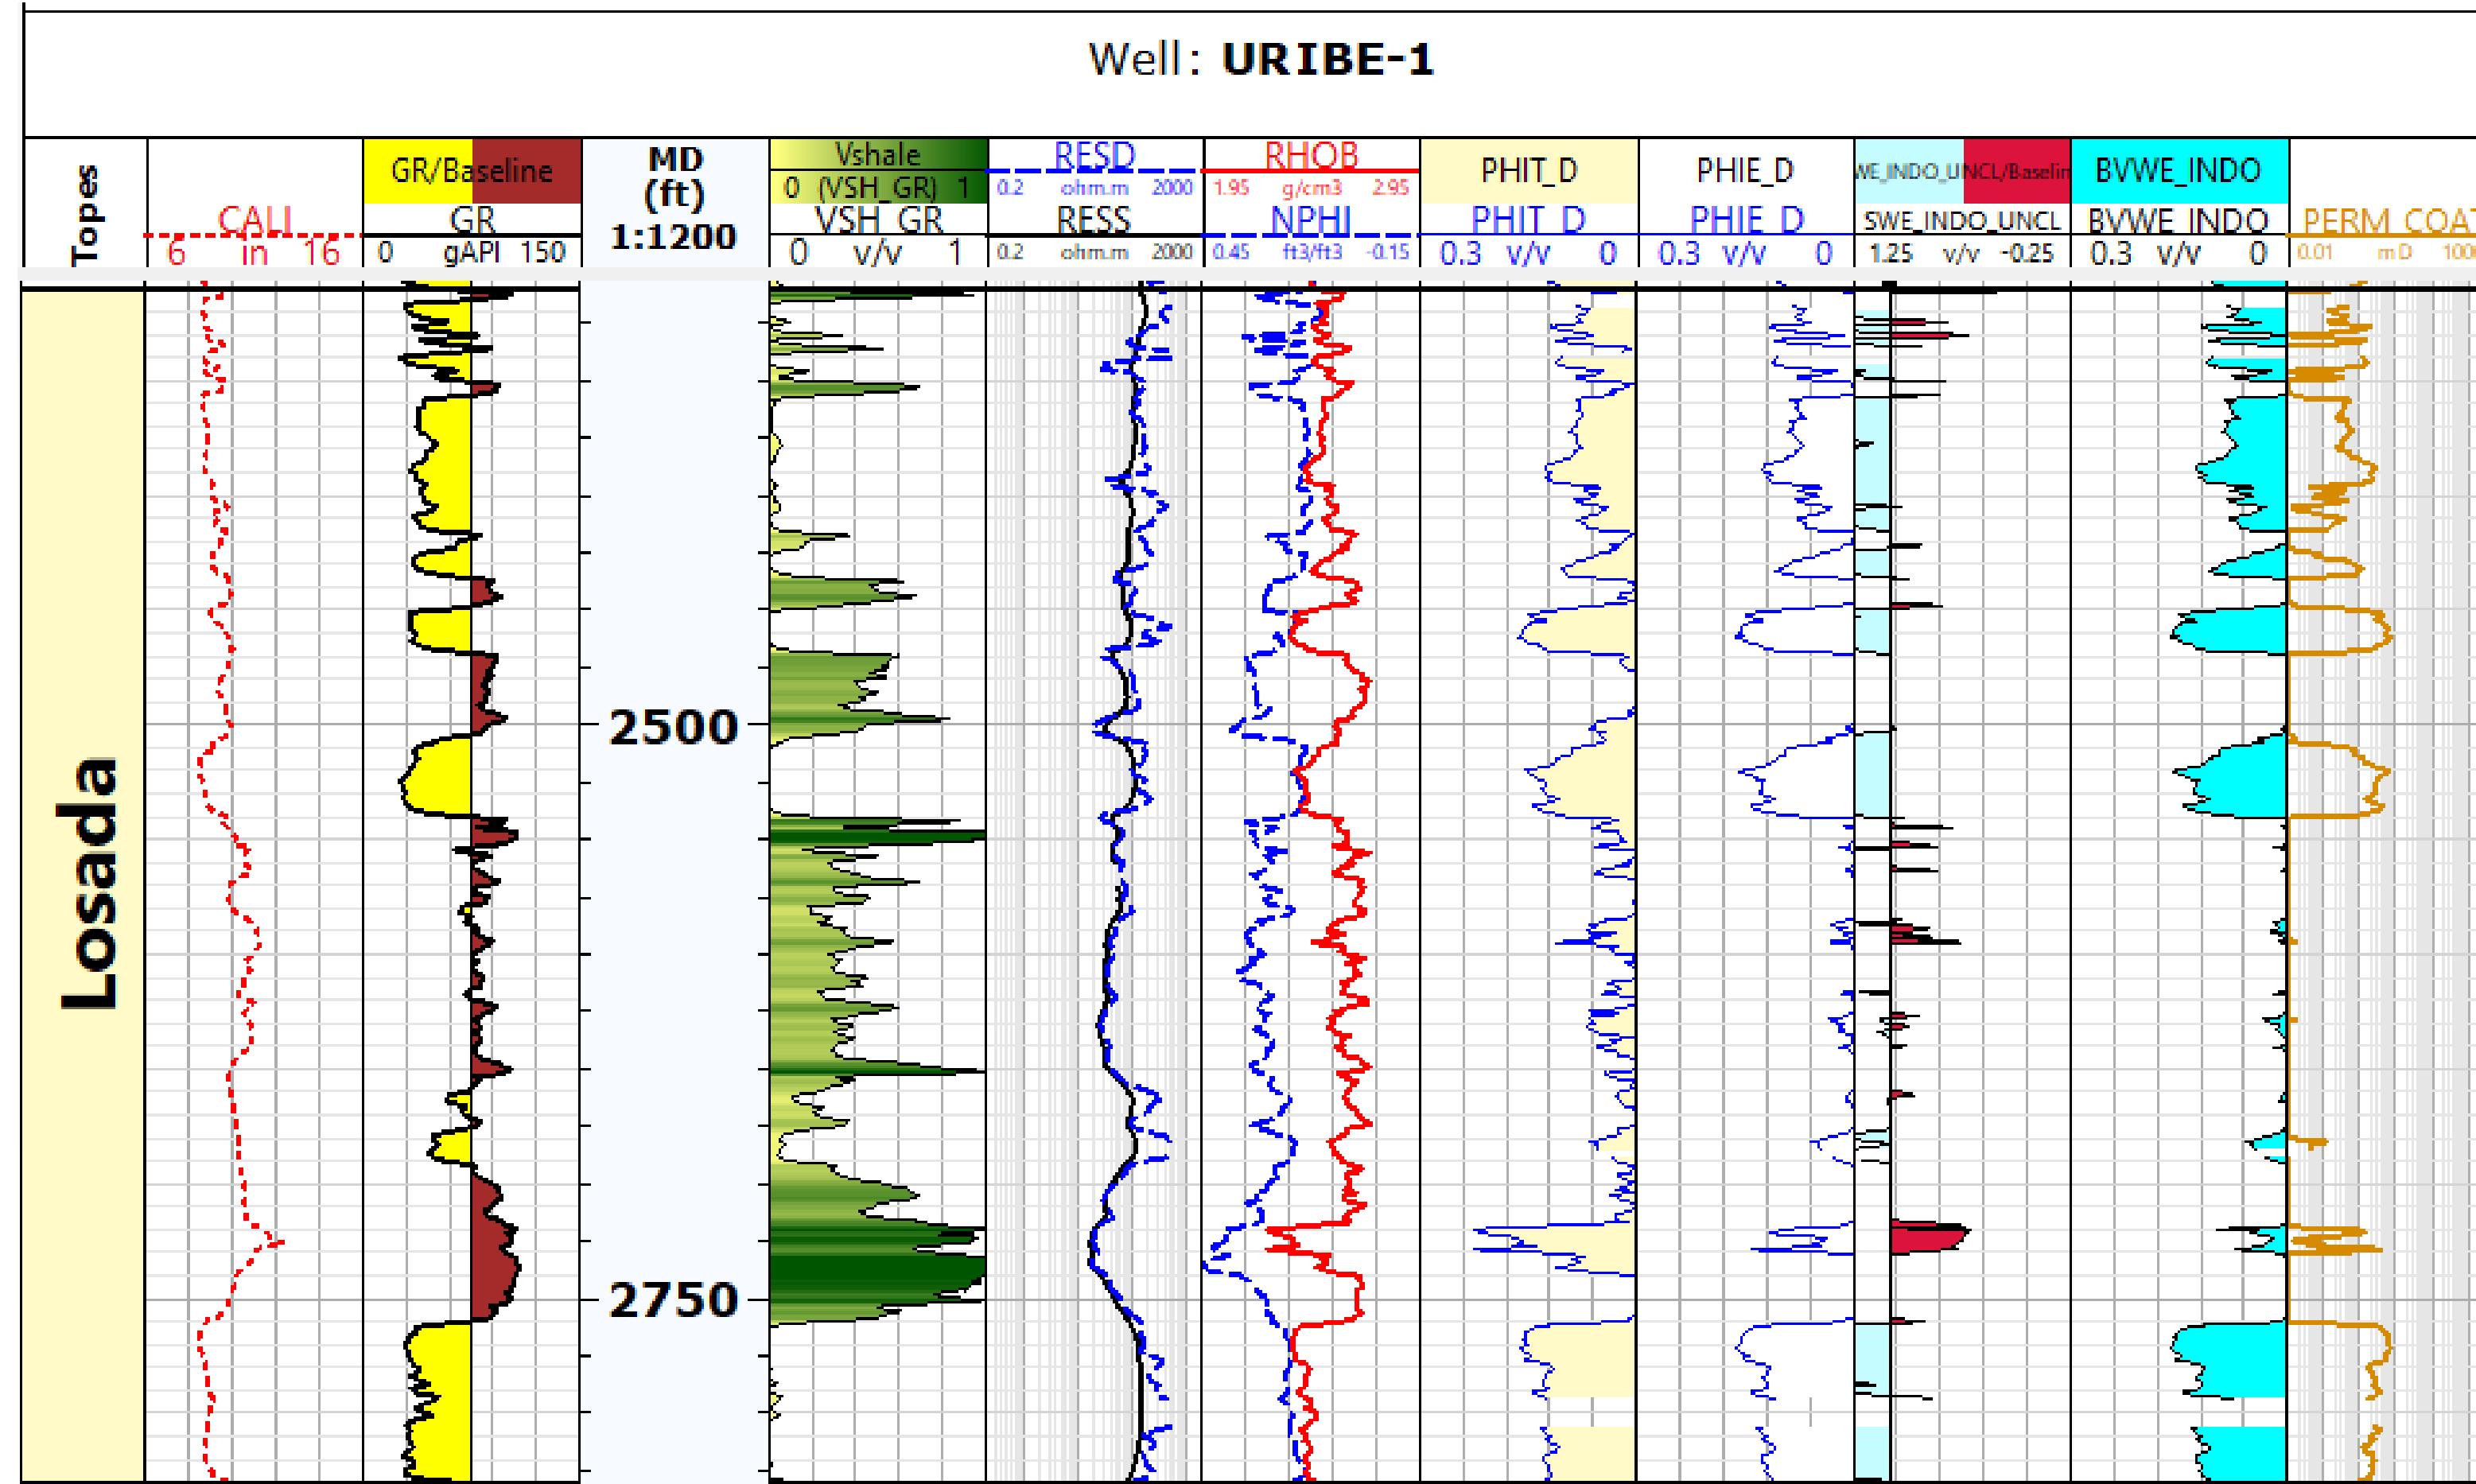

- Upper interval shows good reservoir potential
- Average porosity 35%, water saturated (D-N logs)
- Average Permeability of 1000 mD allows mobility (Resistivity logs)

- Average porosity around under 15%.
- Permeability around 100 mD, fluid mobility

RESERVOIR EVALUATION

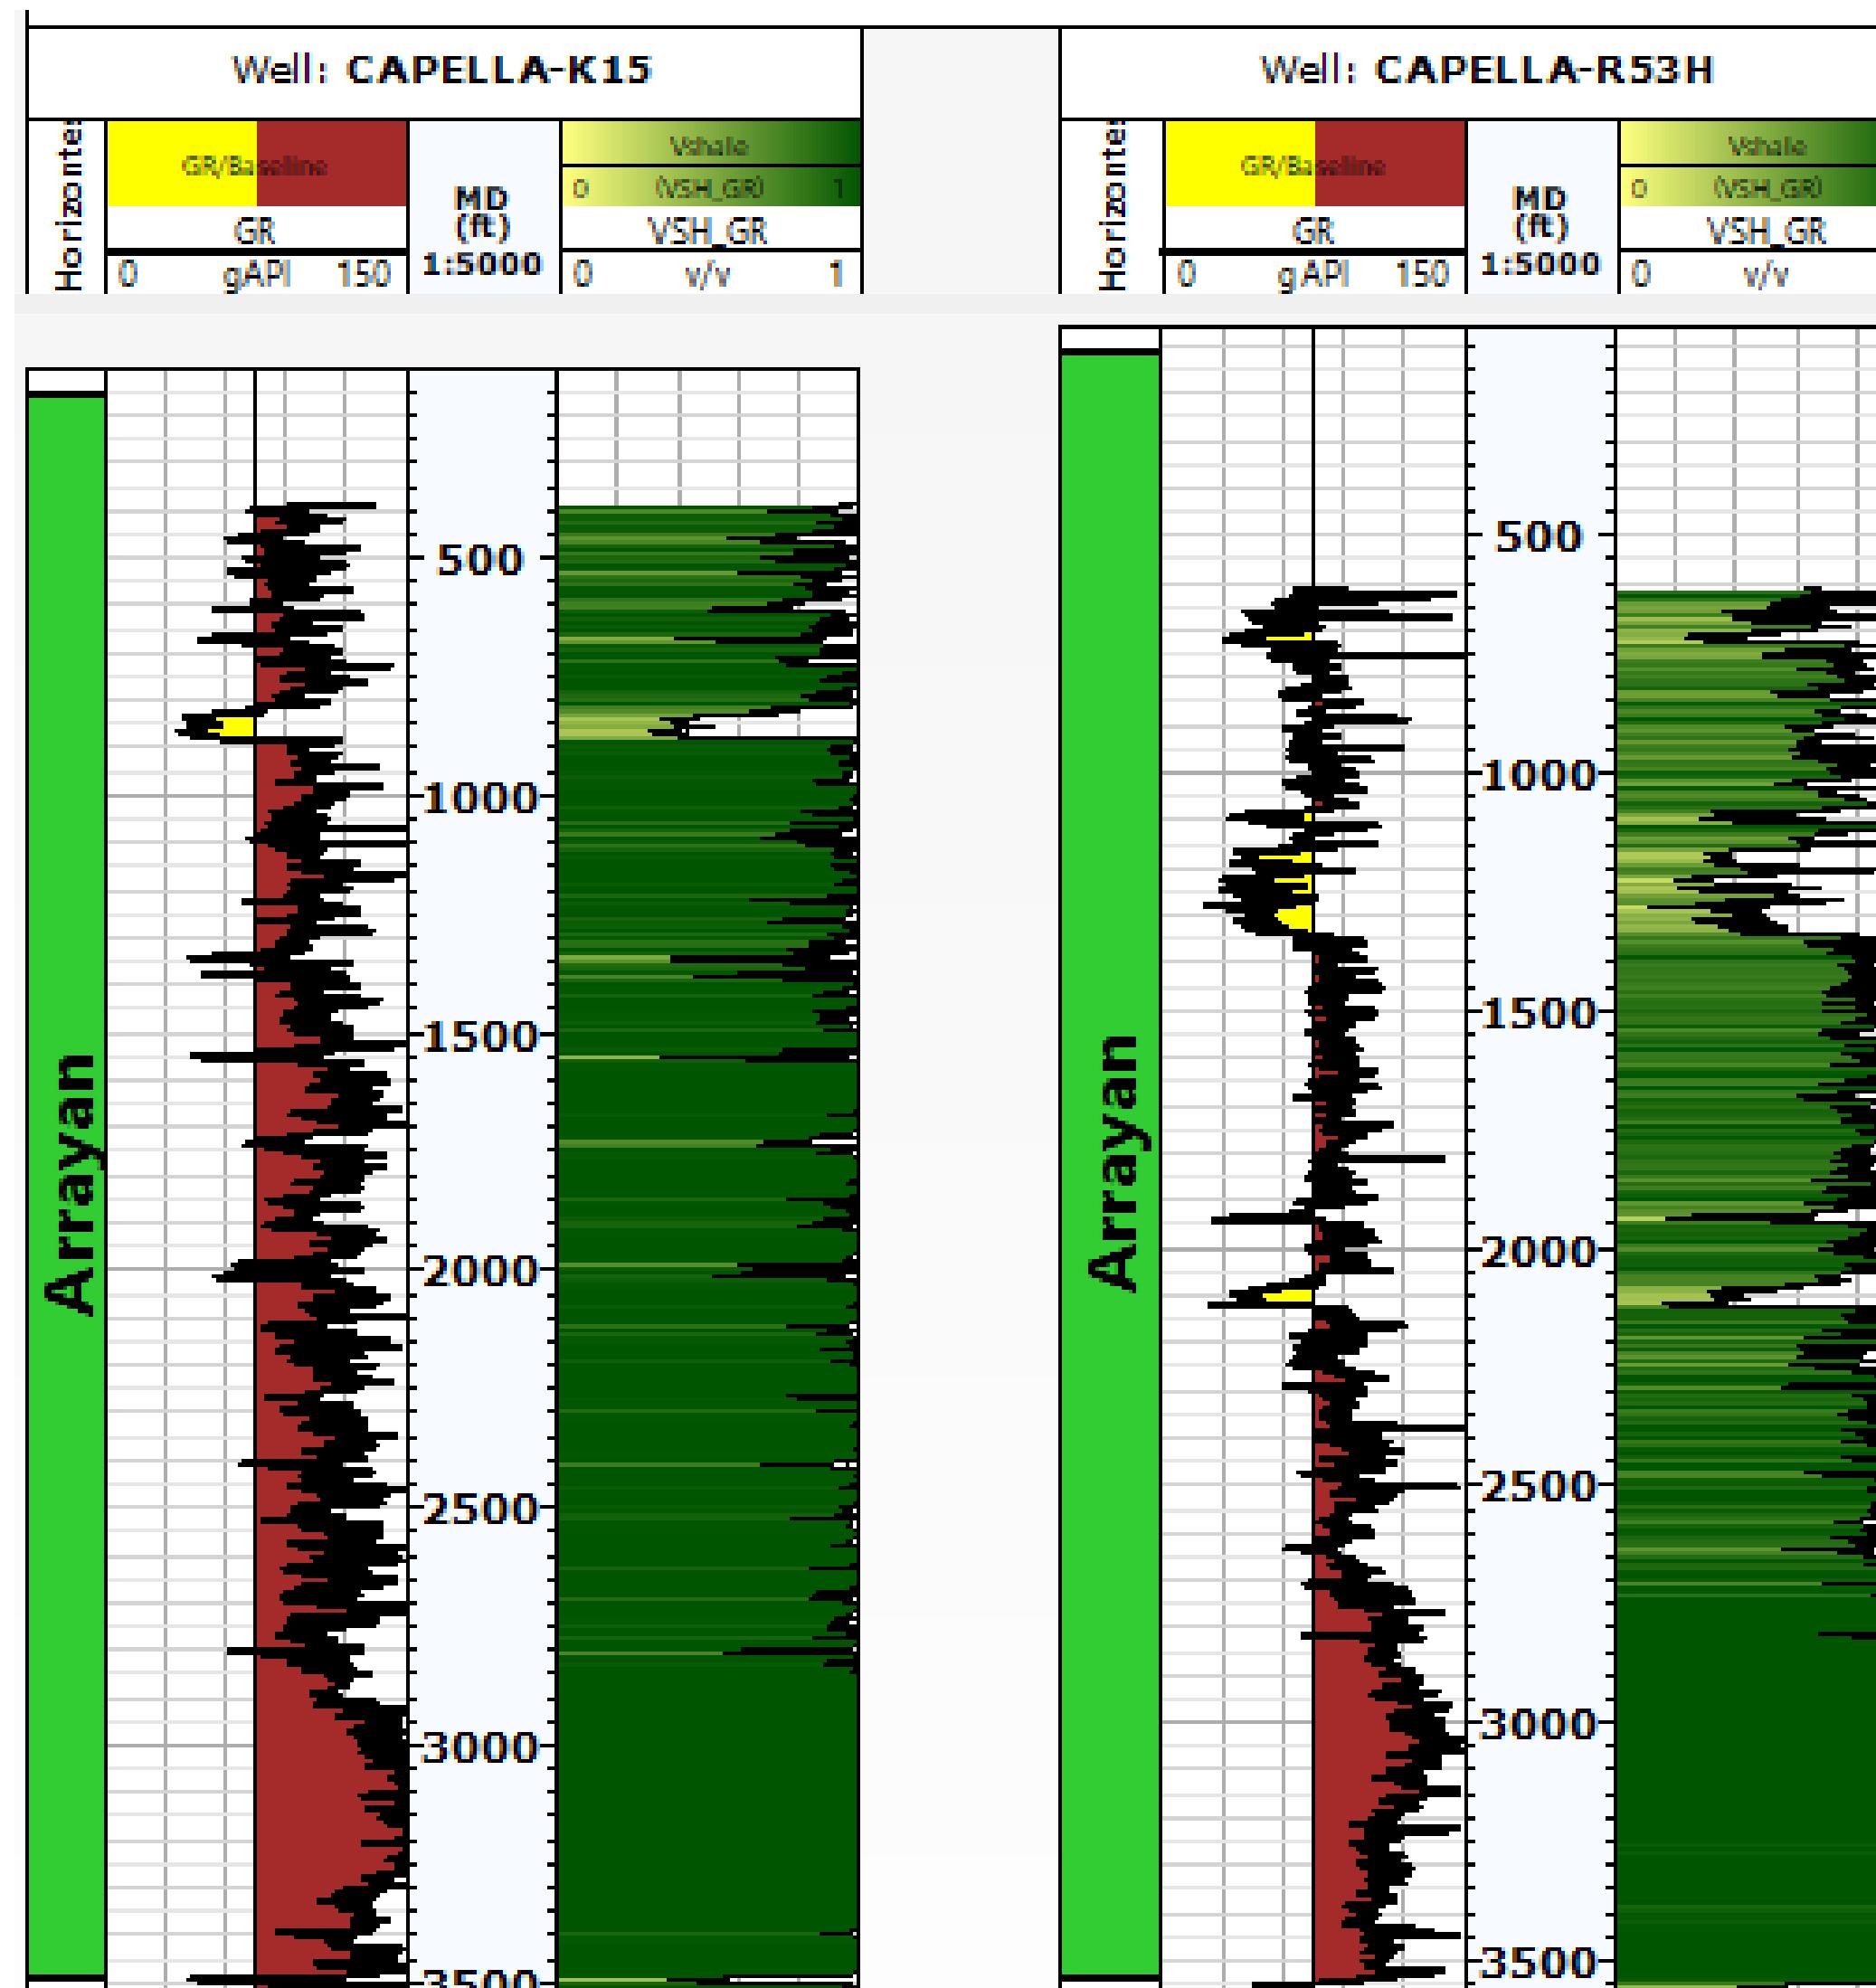

Losada Formation (Mirador eq.)

- GR 30-70 API shows Res zones with clean sandstones
- Vclay < 10%.
- High resistivity and deflection support possible fluid mobility
- Maximum porosity of 15%
- Permeability about 5 mD.
- Potential reservoir unit

SEAL EVALUATION

Arrayán Formation

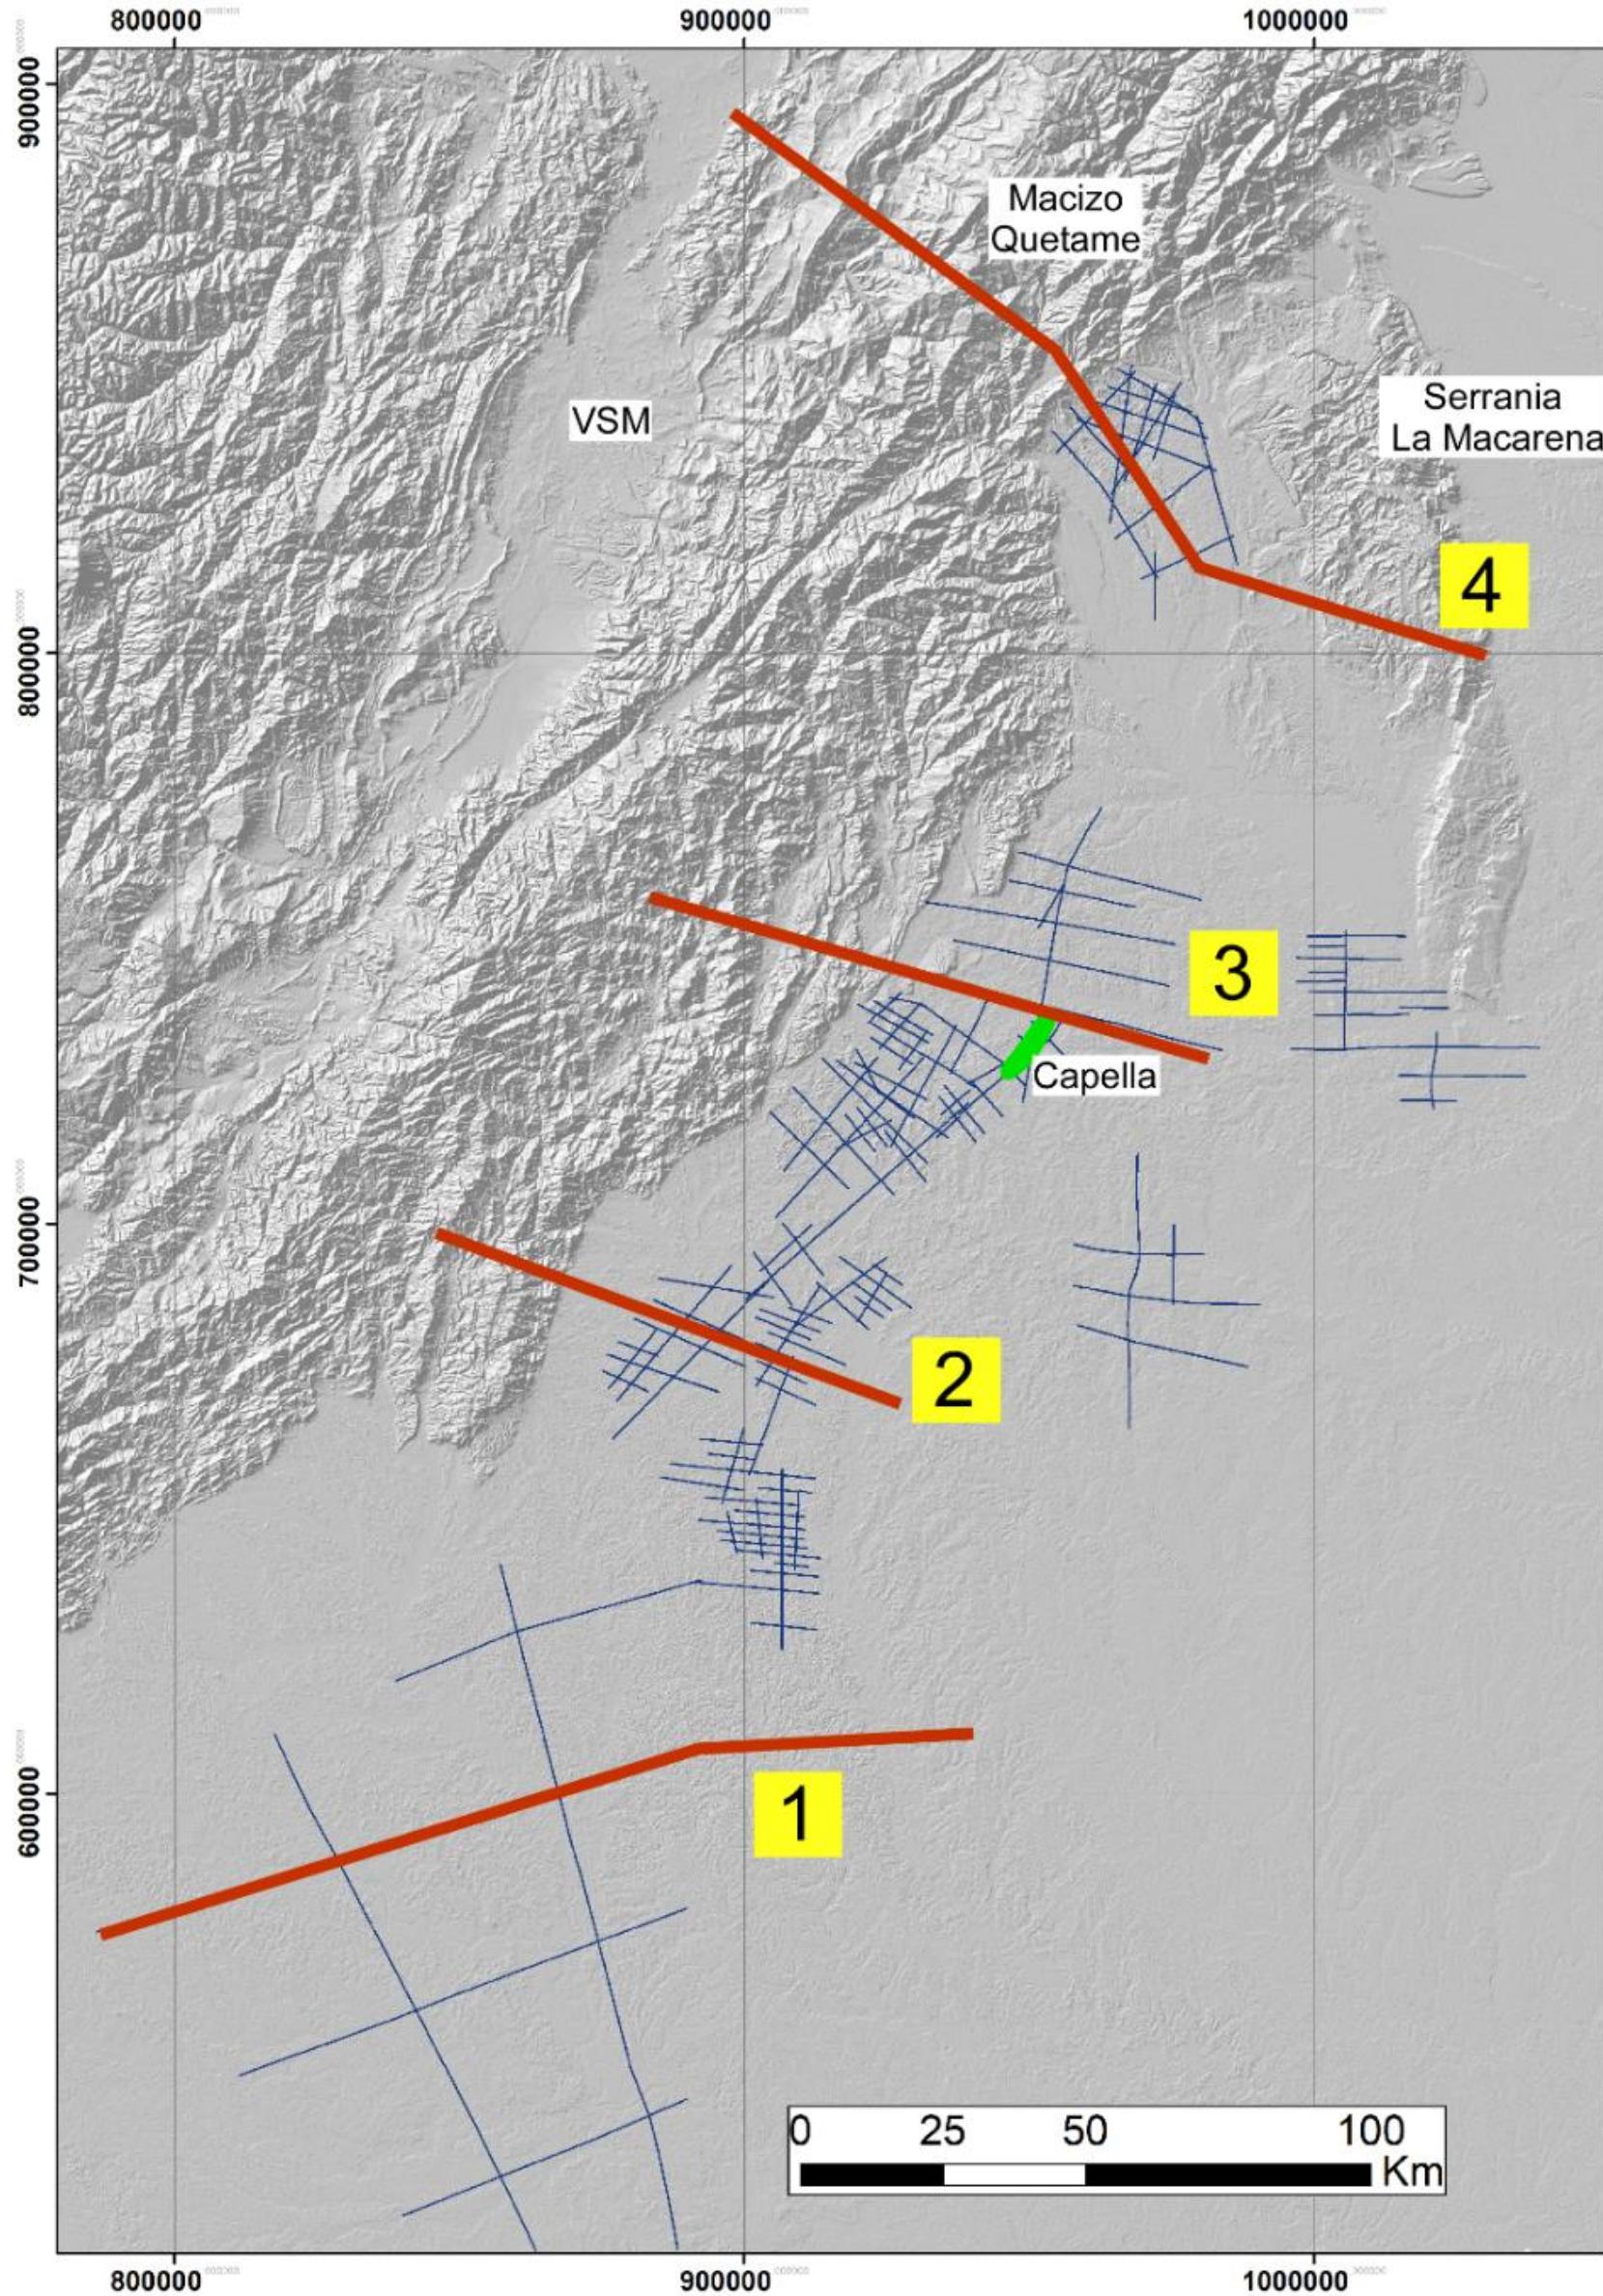

- Regional ultimate seal composed of massive claystones 3000 ft + thick
- Incomplete set of logs acquired this unit, only studied in Capella wells
- GR values vary from 65-90 API
- Vclay 65%-80%
- Sandstone intercalations with Vclay under 35% and reservoir potential occur towards the top

Structural sections / Plays, prospects and leads

CATHERINE JAIMES - ANDRES MESA

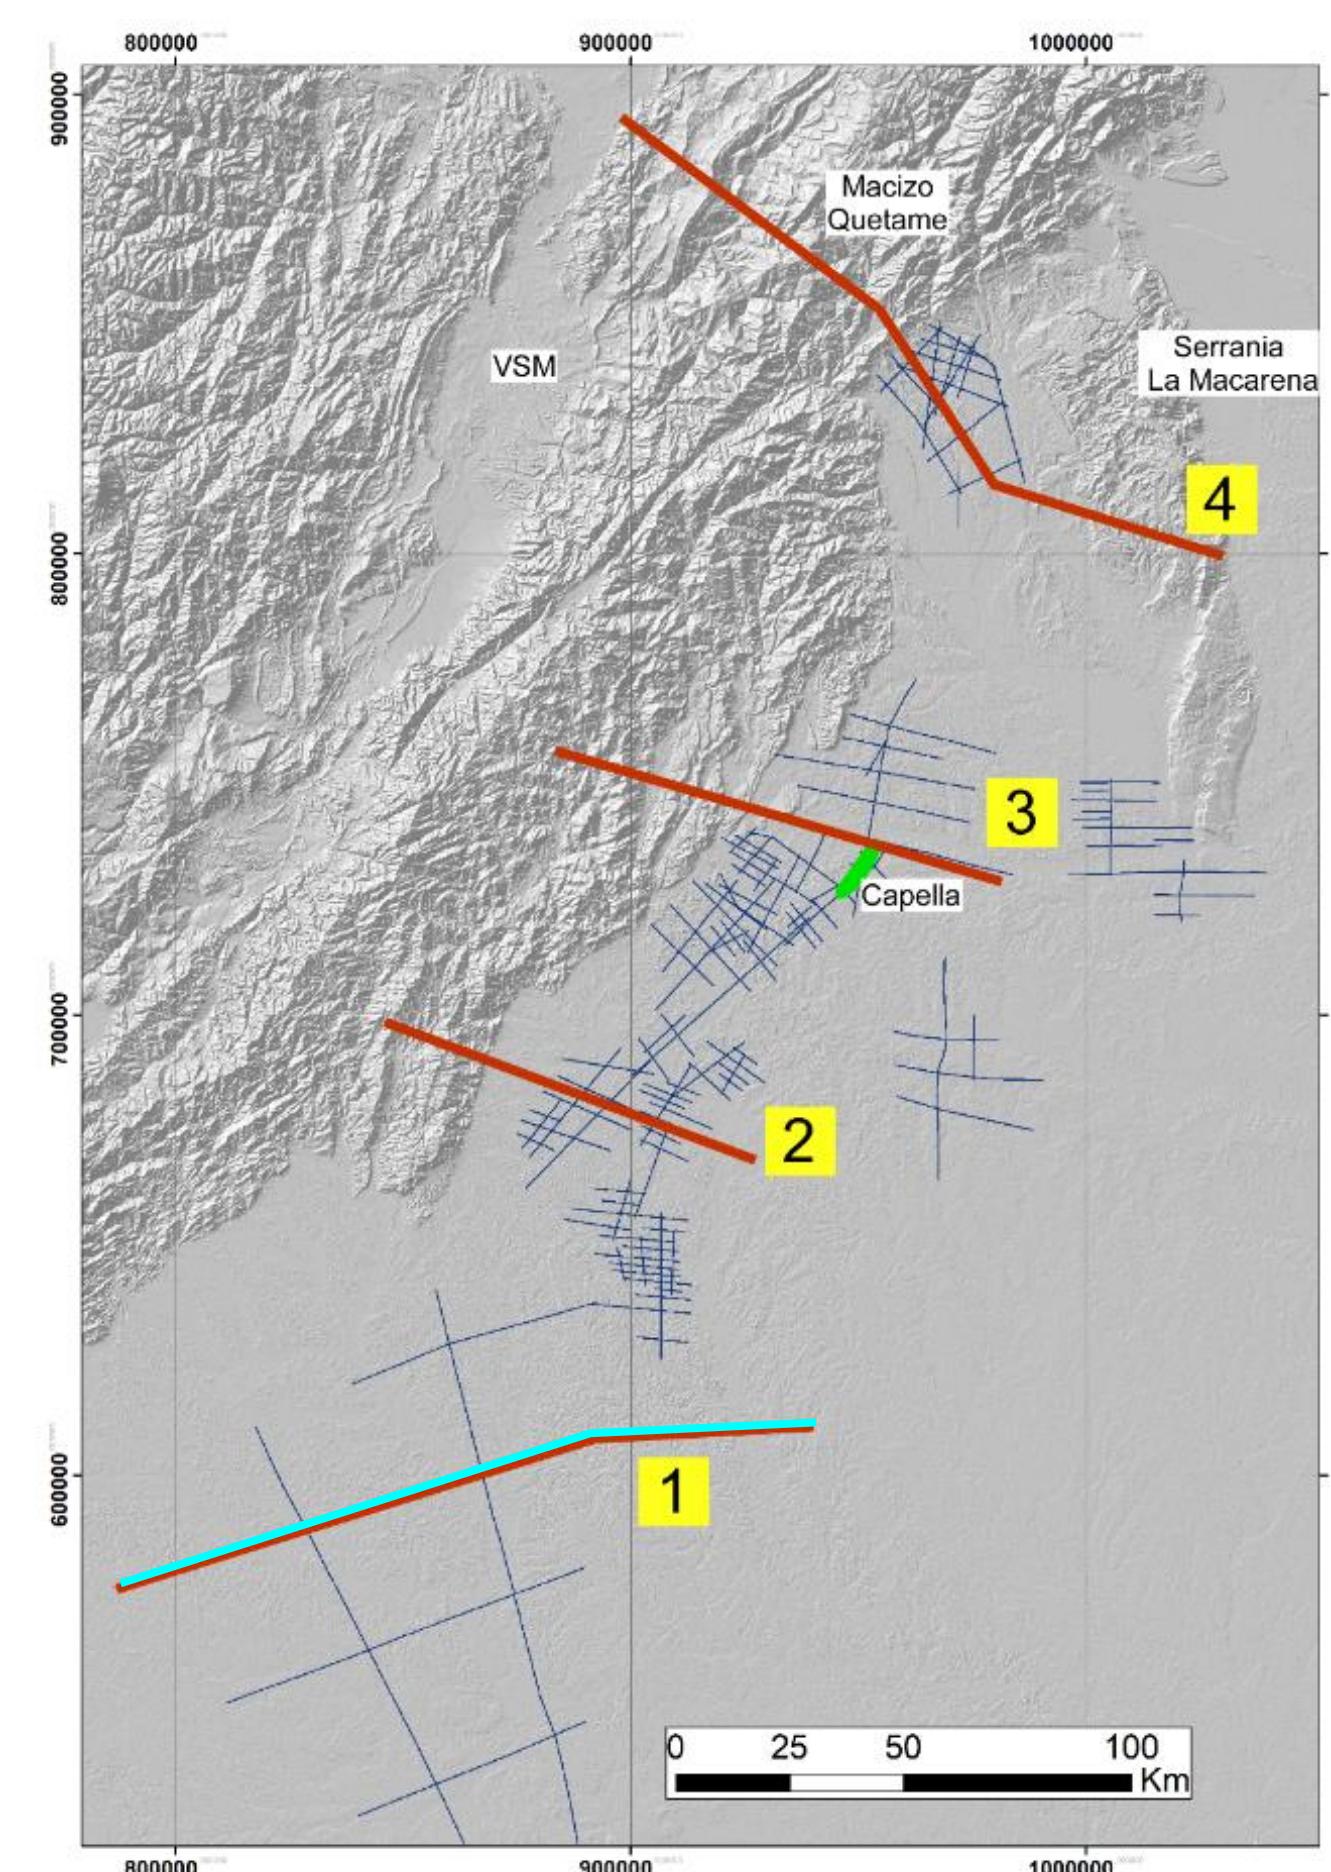

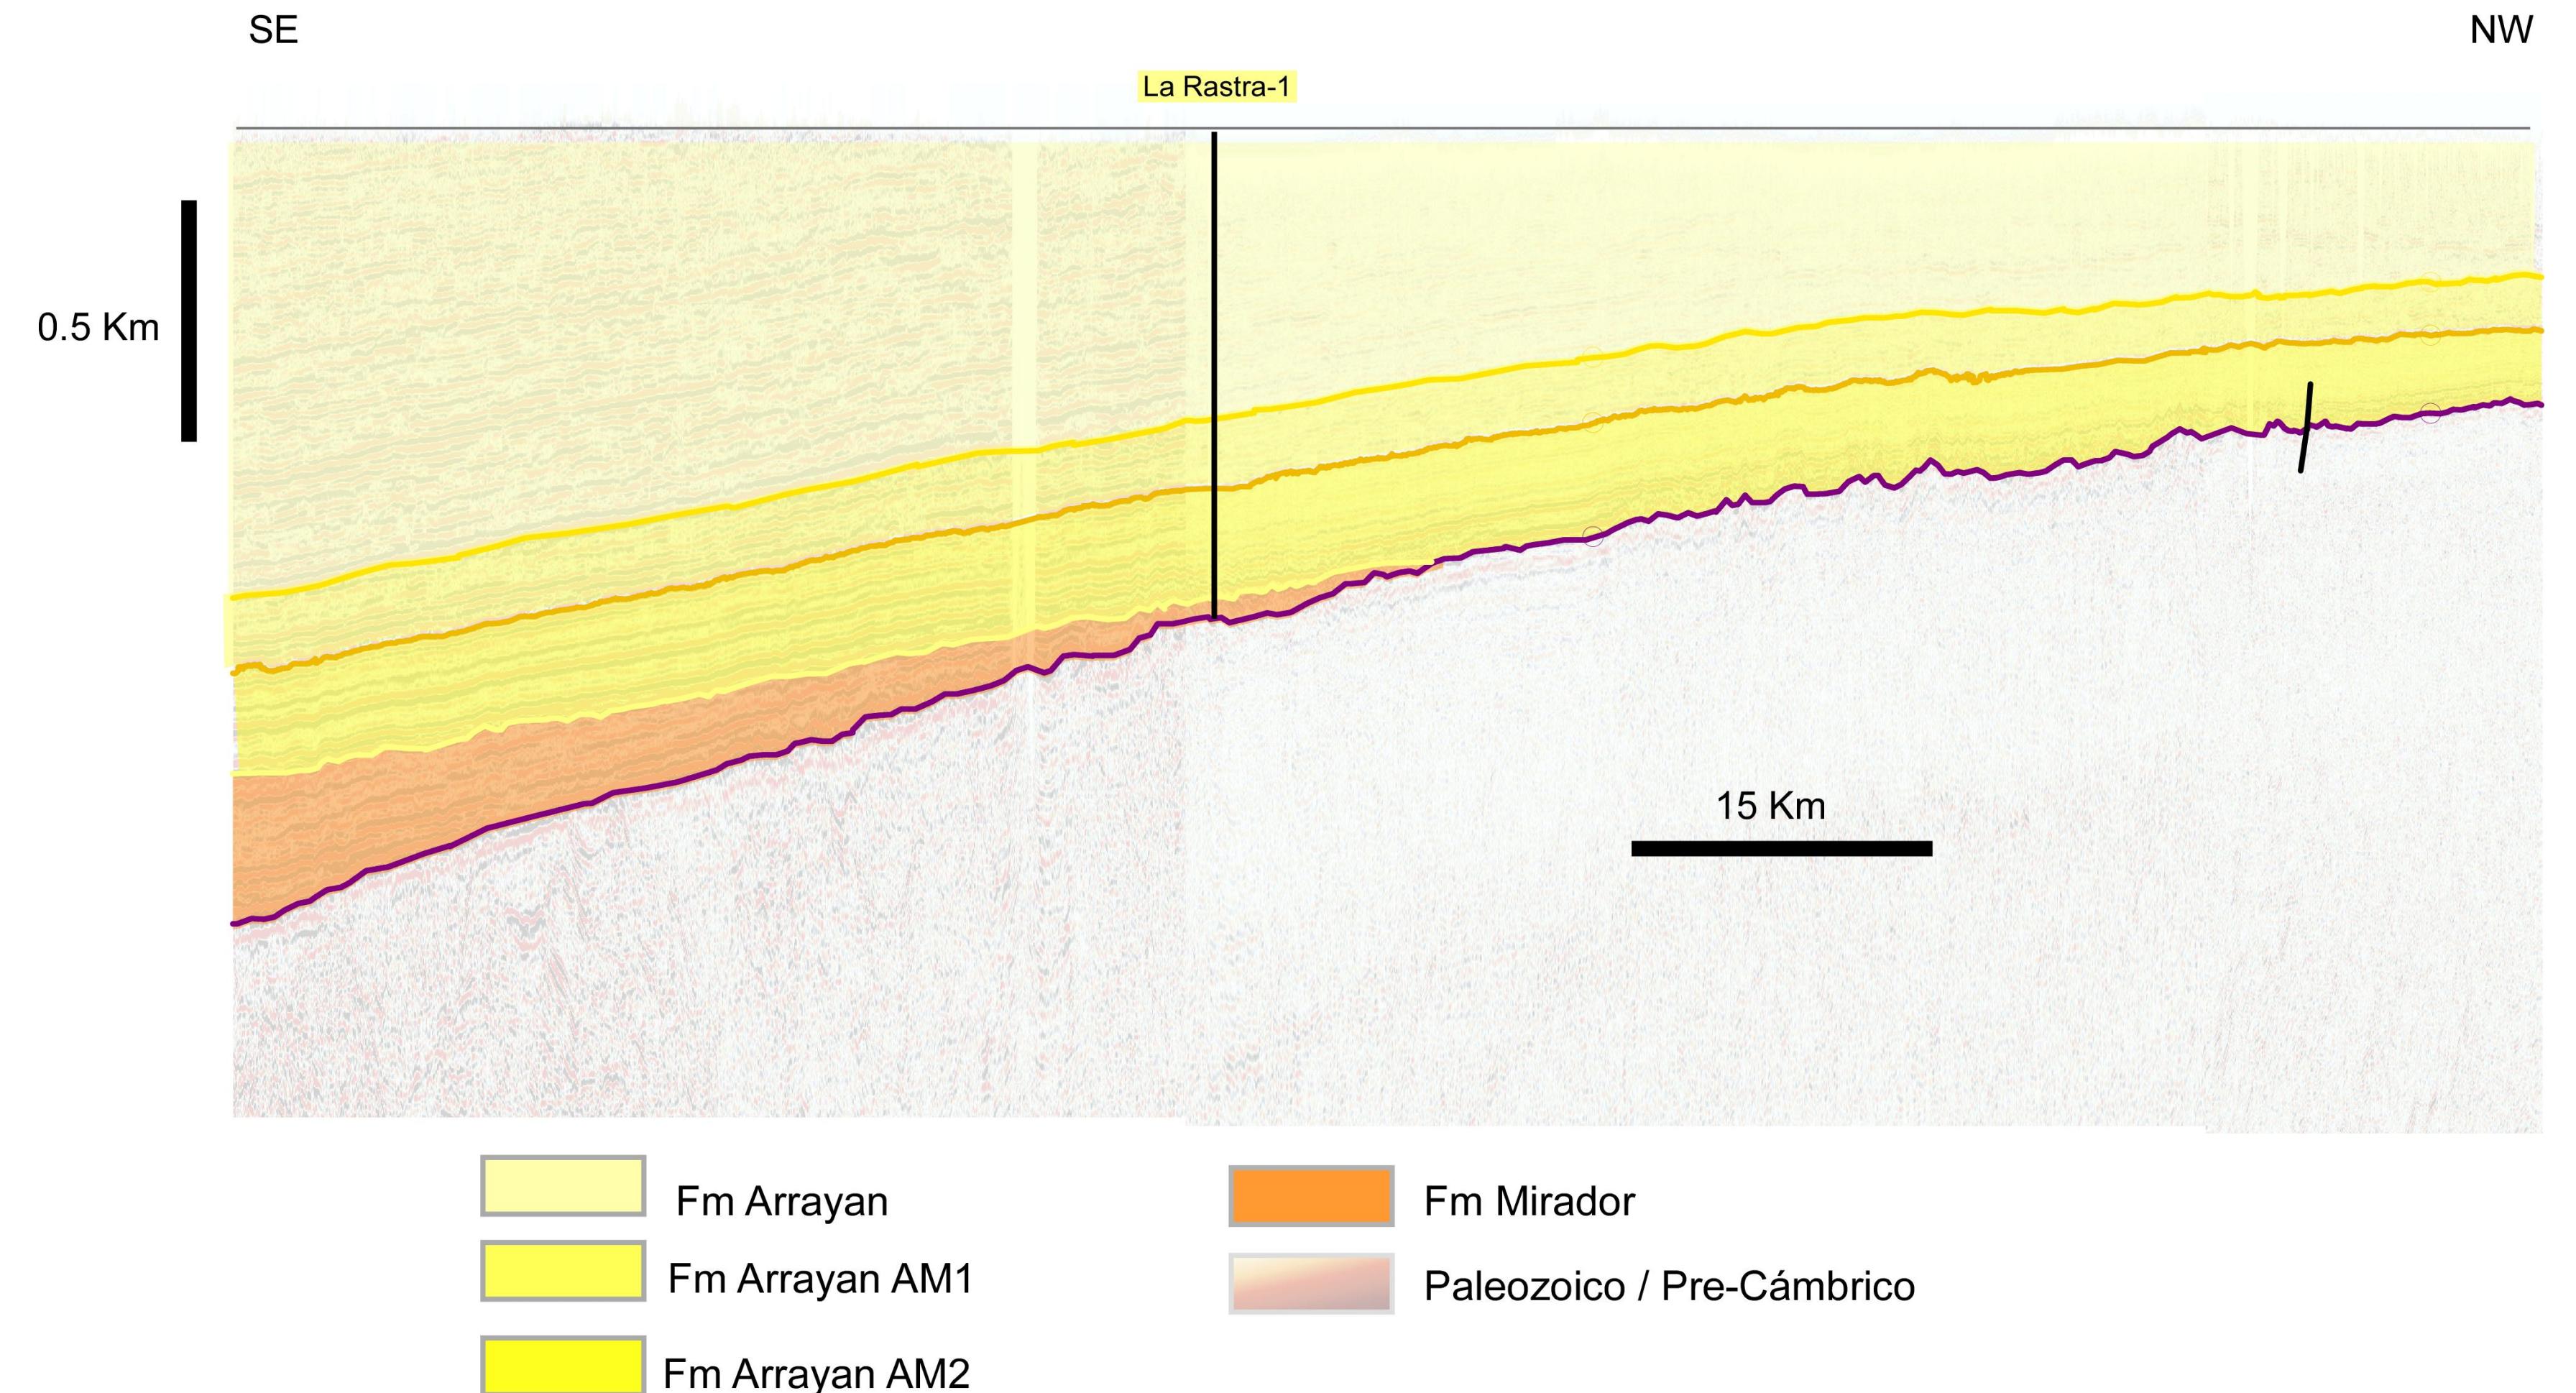

STRUCTURAL FRAMEWORK

- Seismic data base of 3.000 km 2D seismic
- Four transects were done to show the regional structural framework

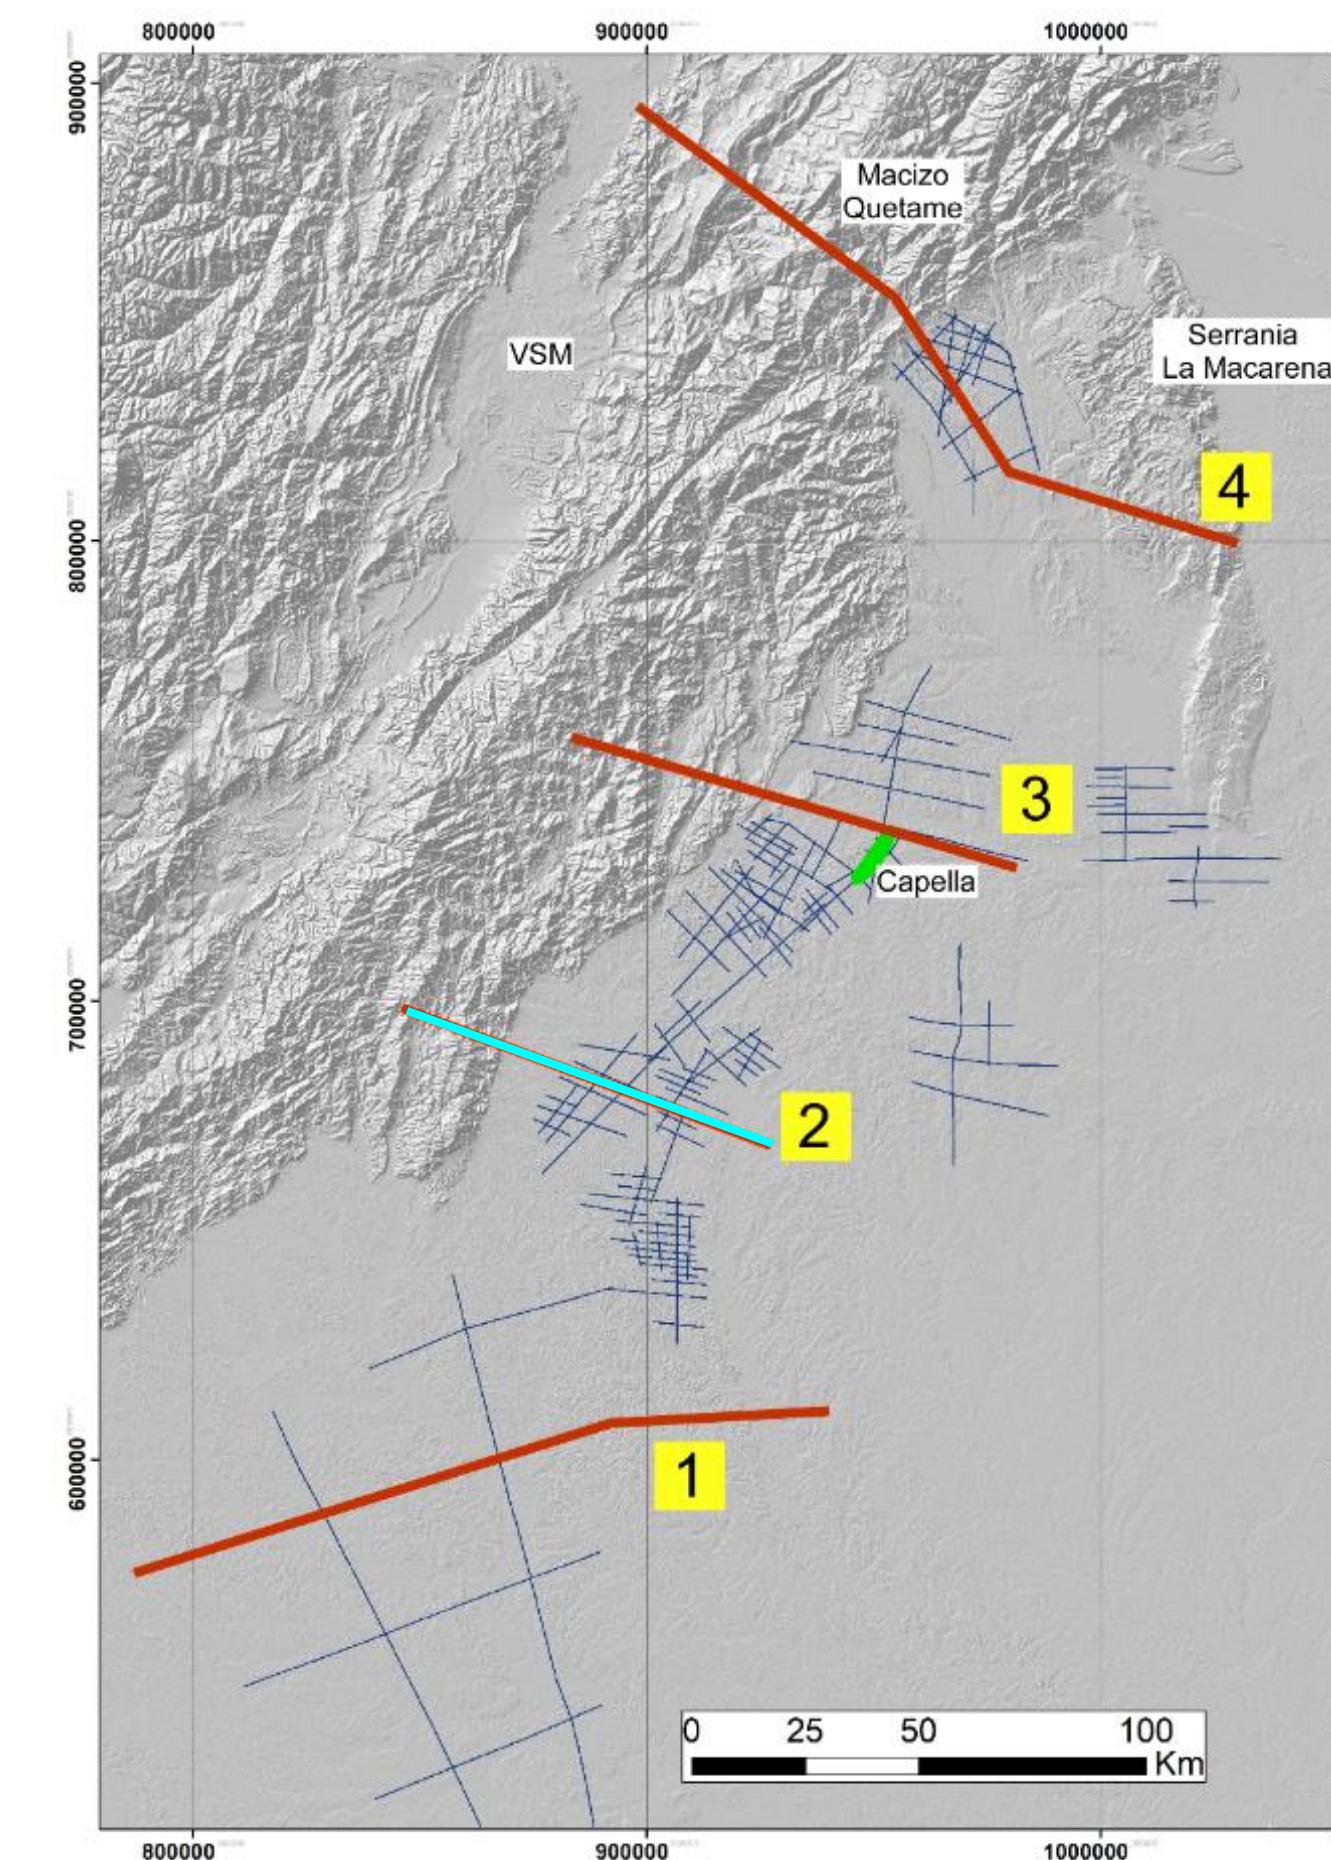

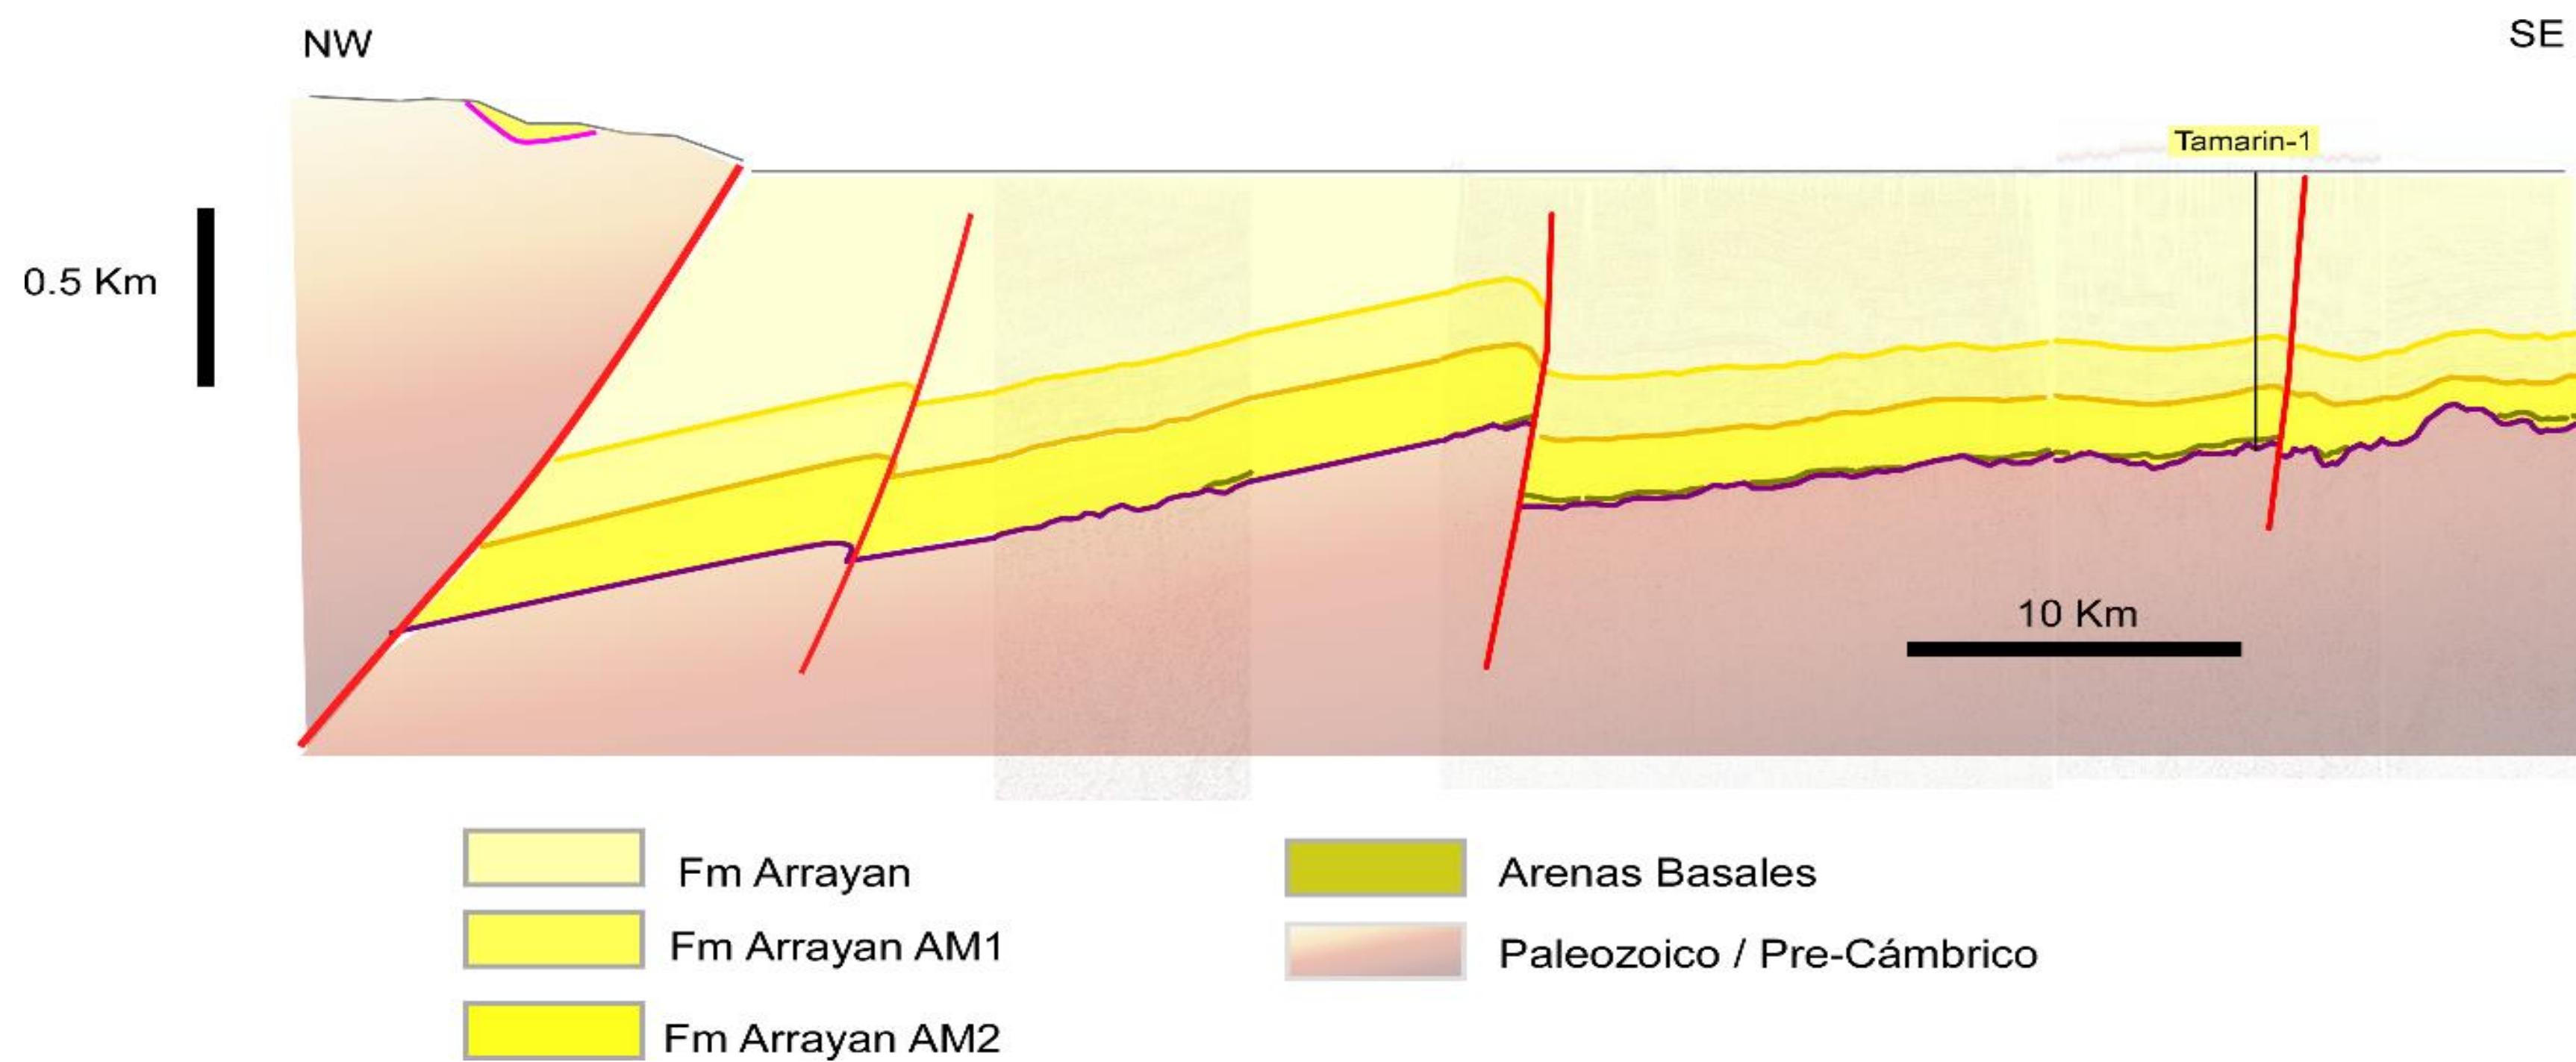

TRANSECT 1

- **Mirador Fm onlap to the East**
- Undefomed area

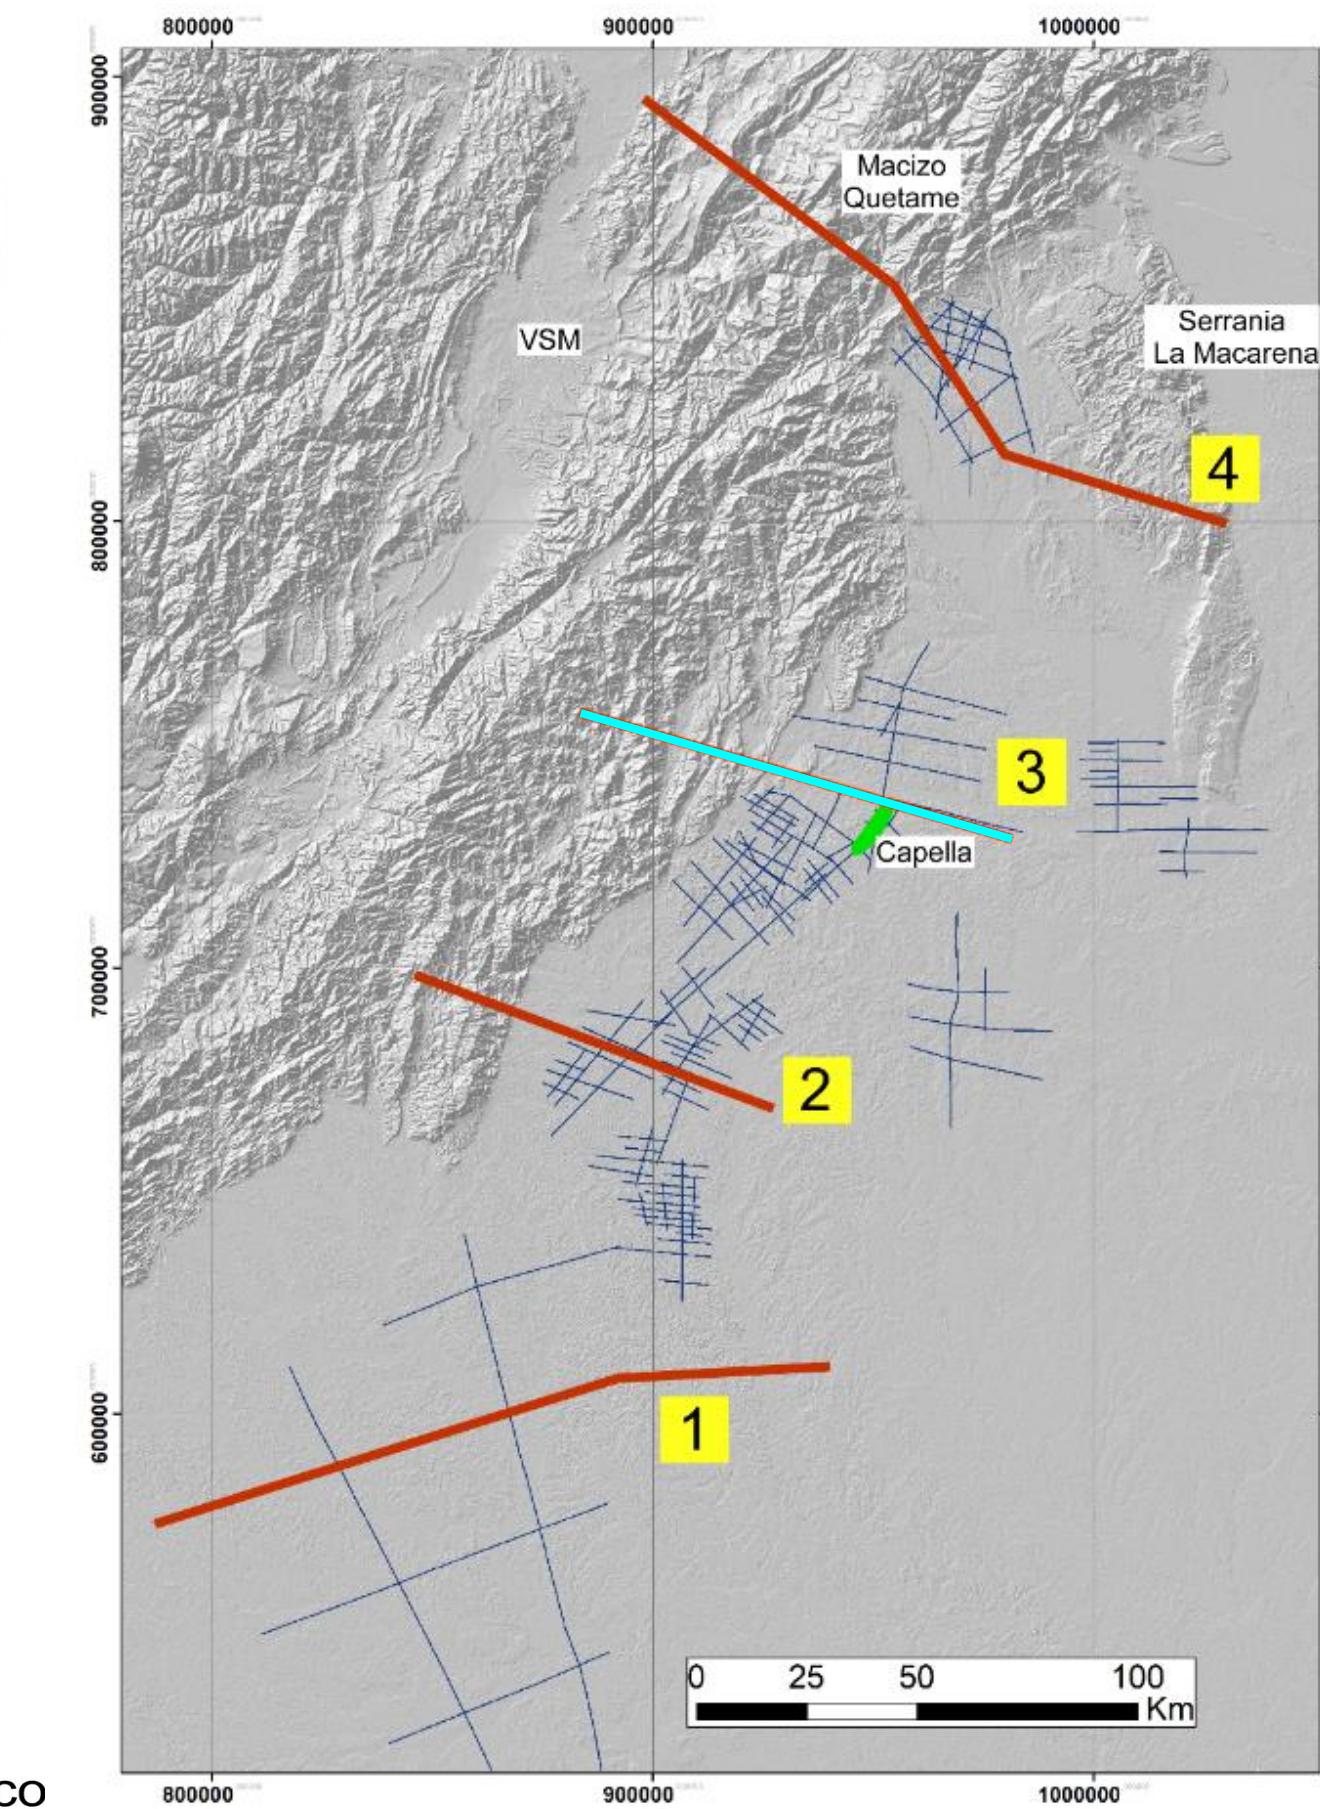

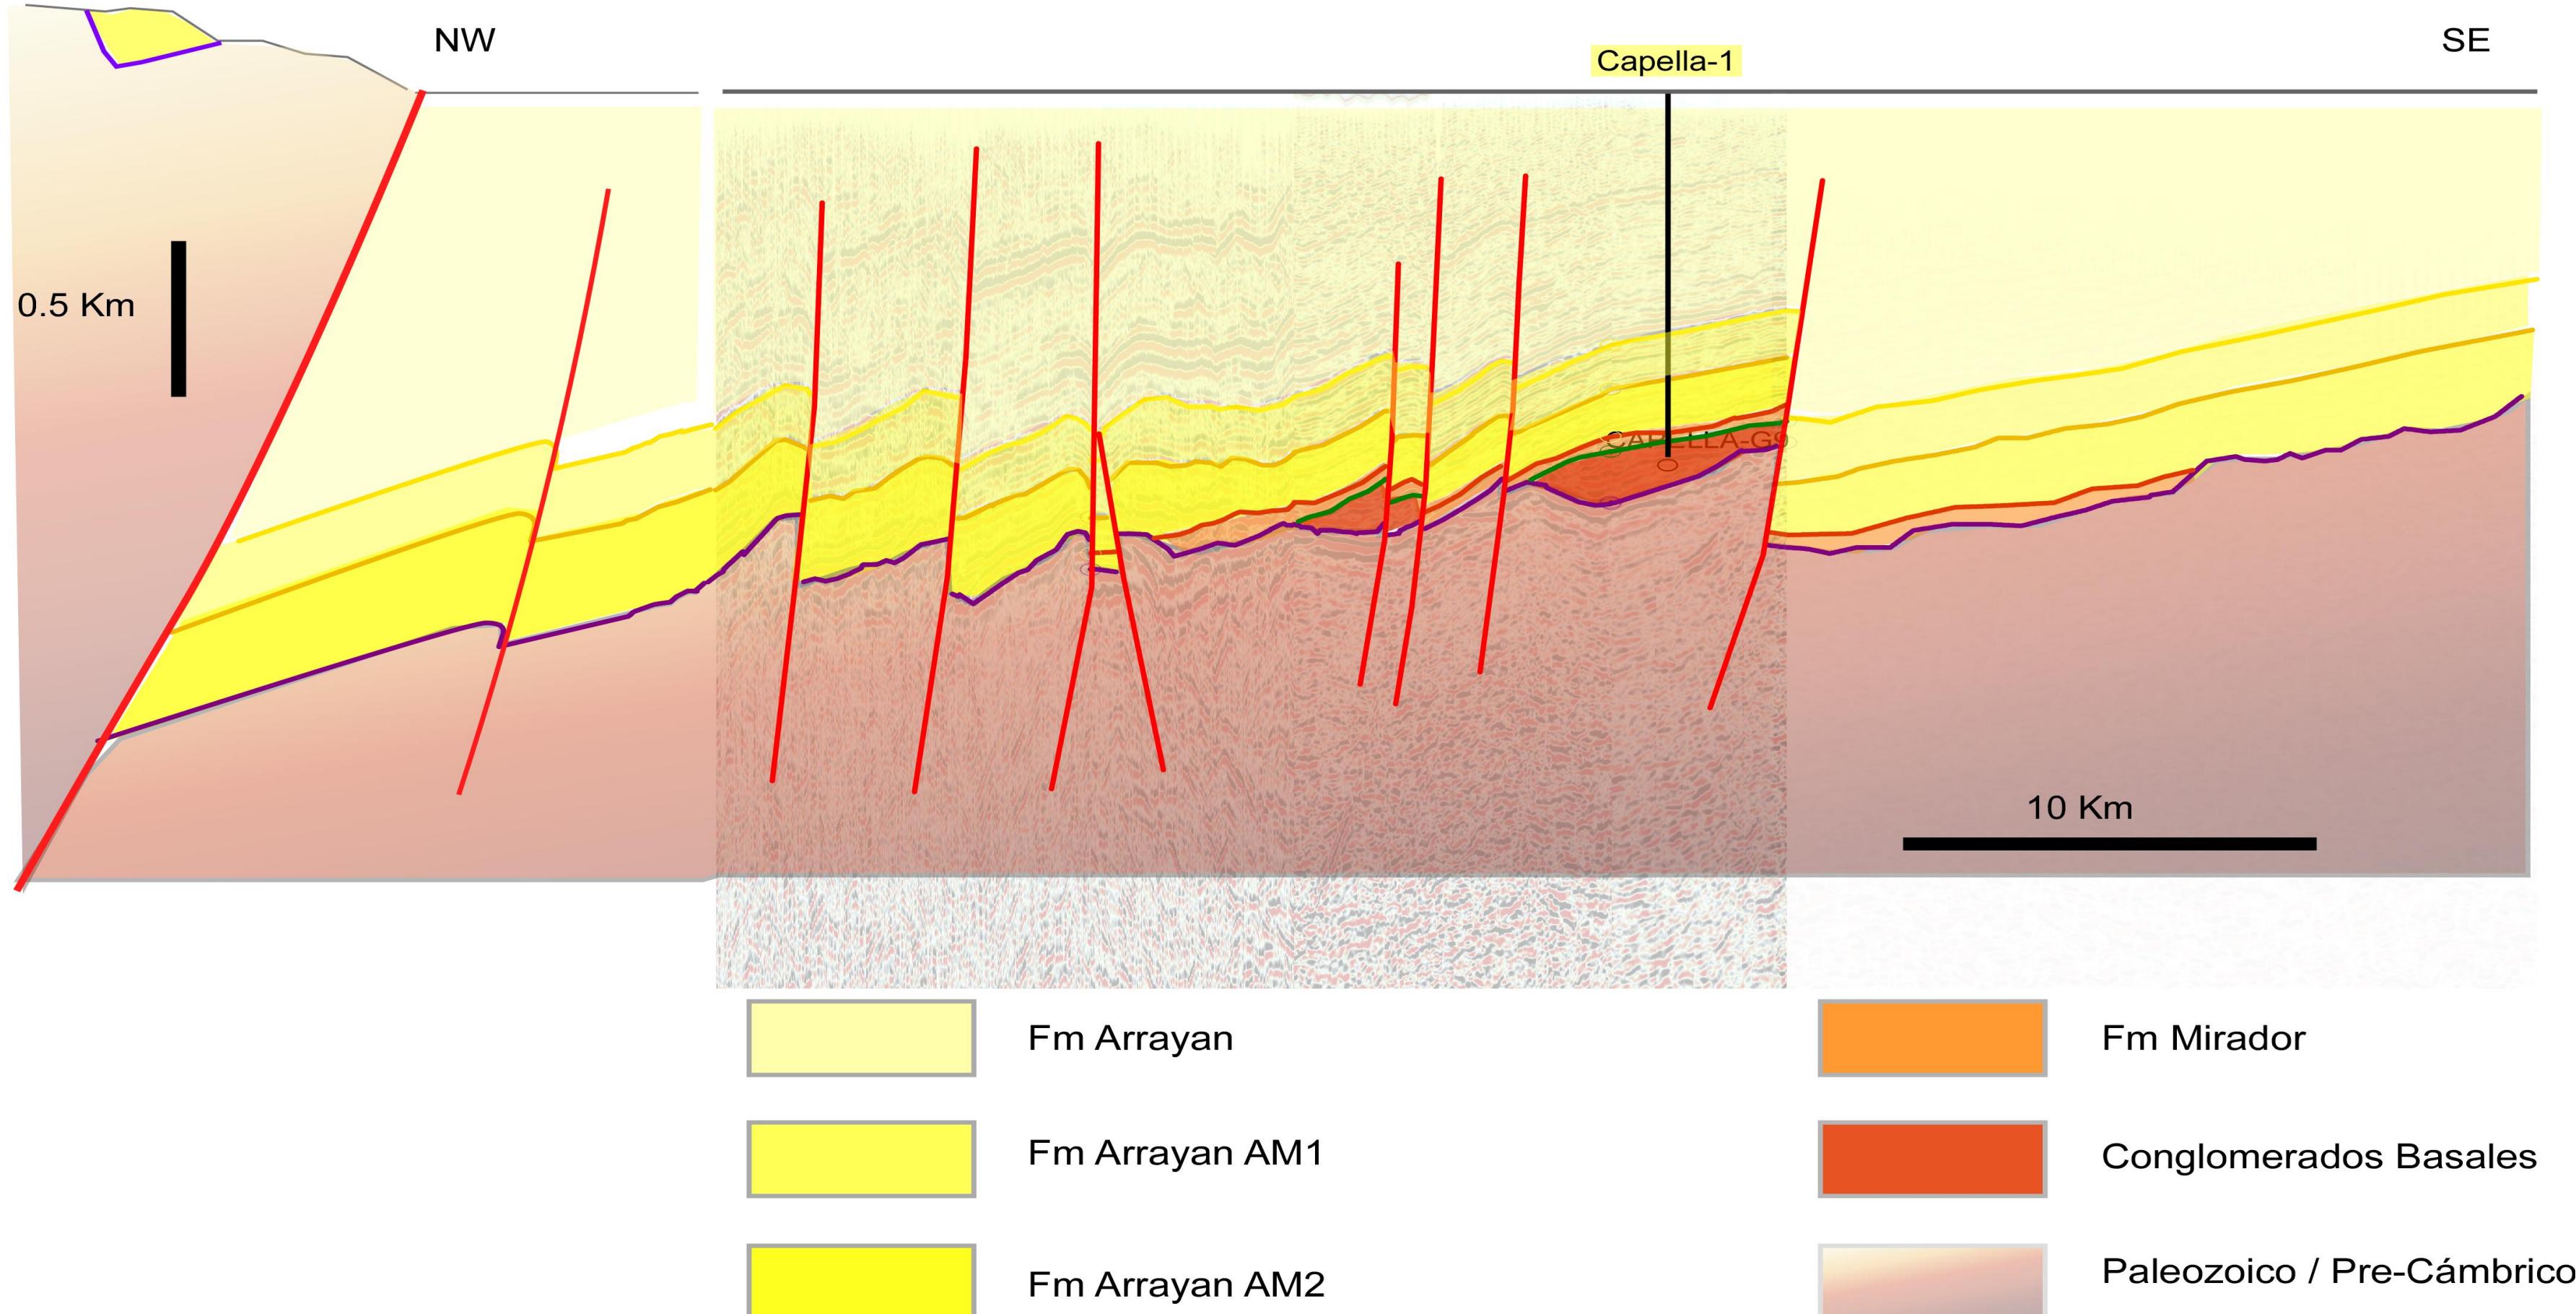

TRANSECT 2

- Low degree of deformation
- Paleo-topography filled with Morelia Fm. Sediments.

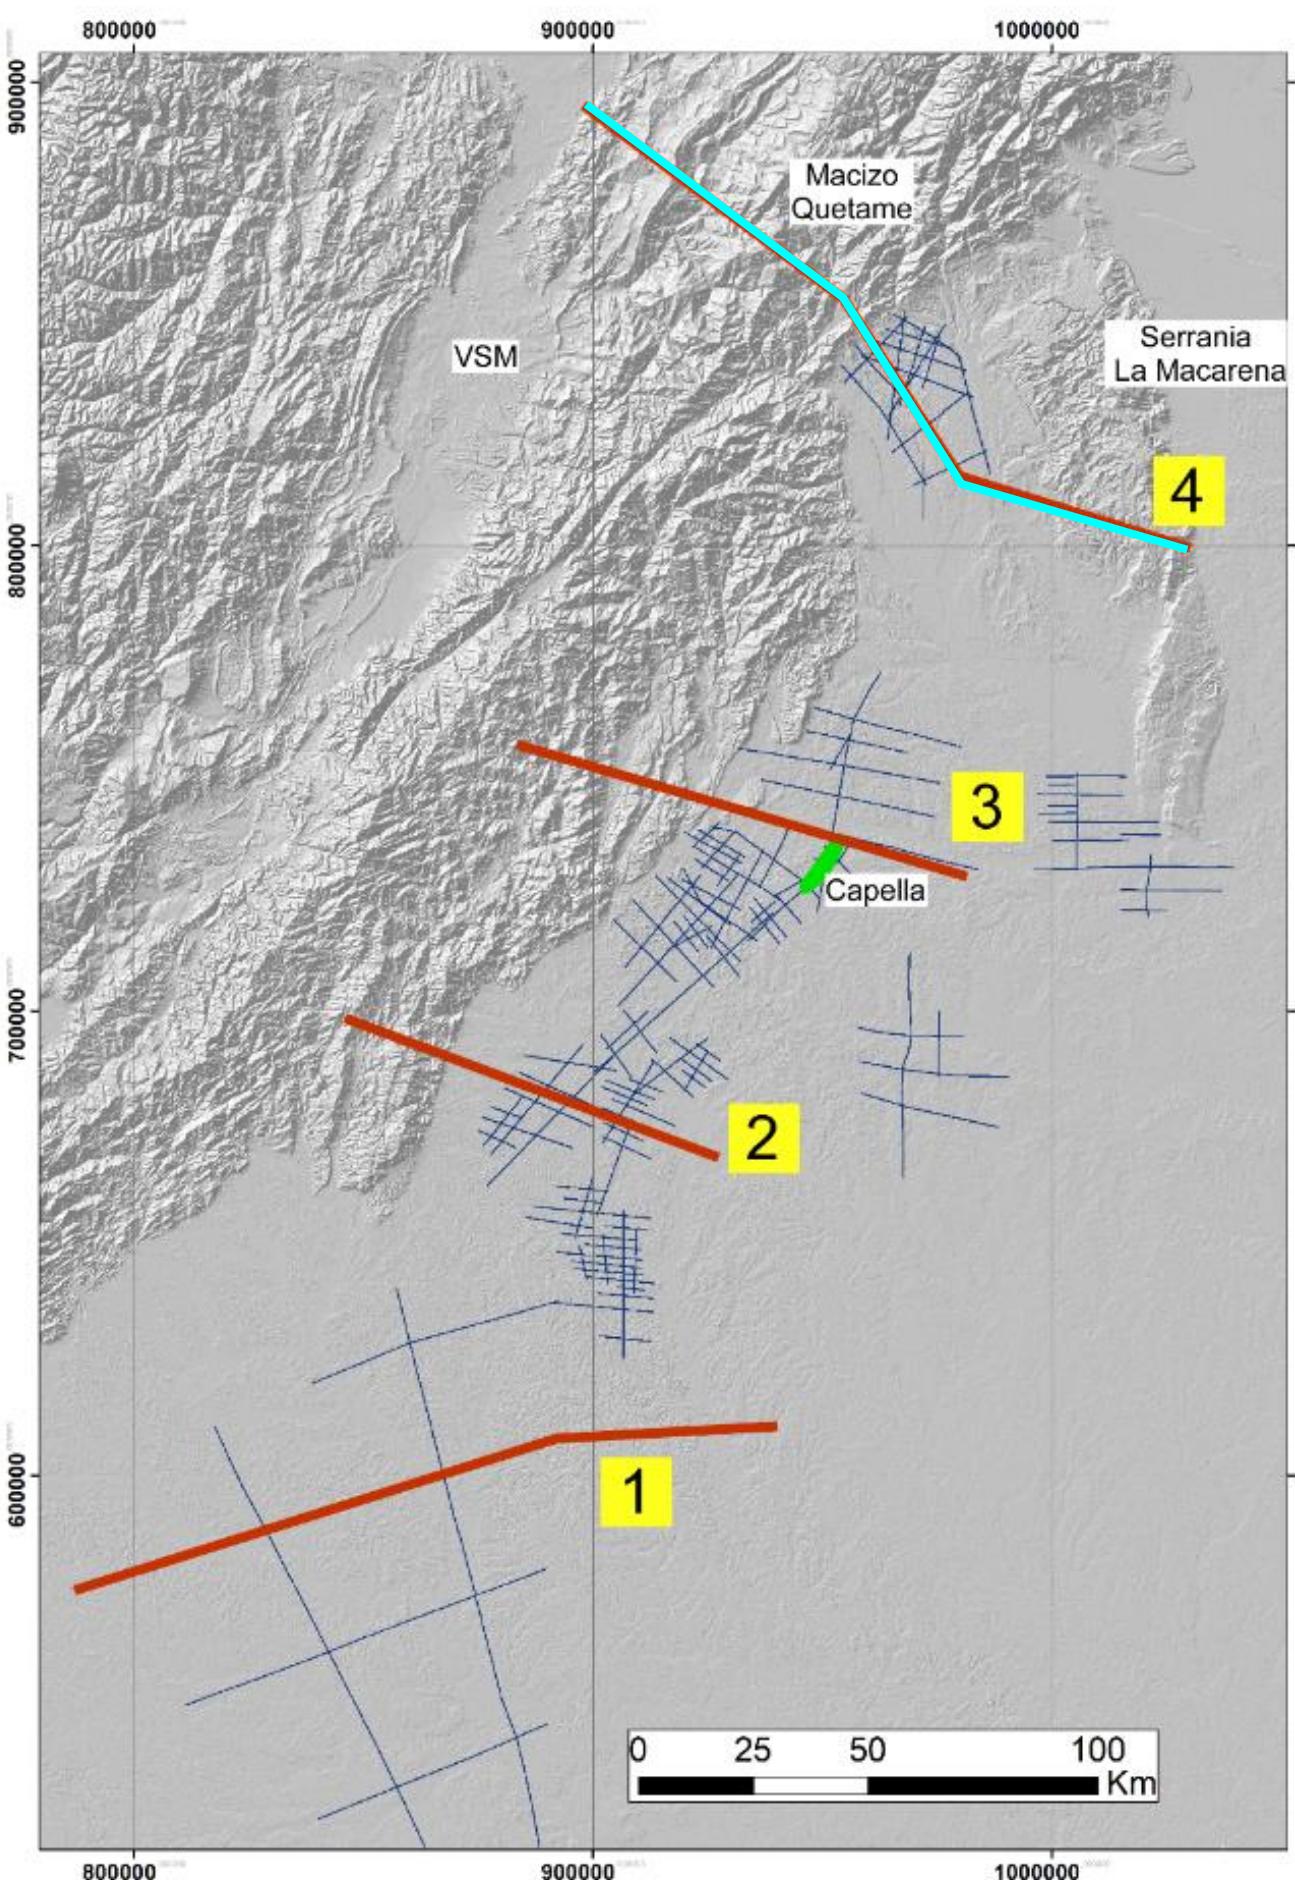

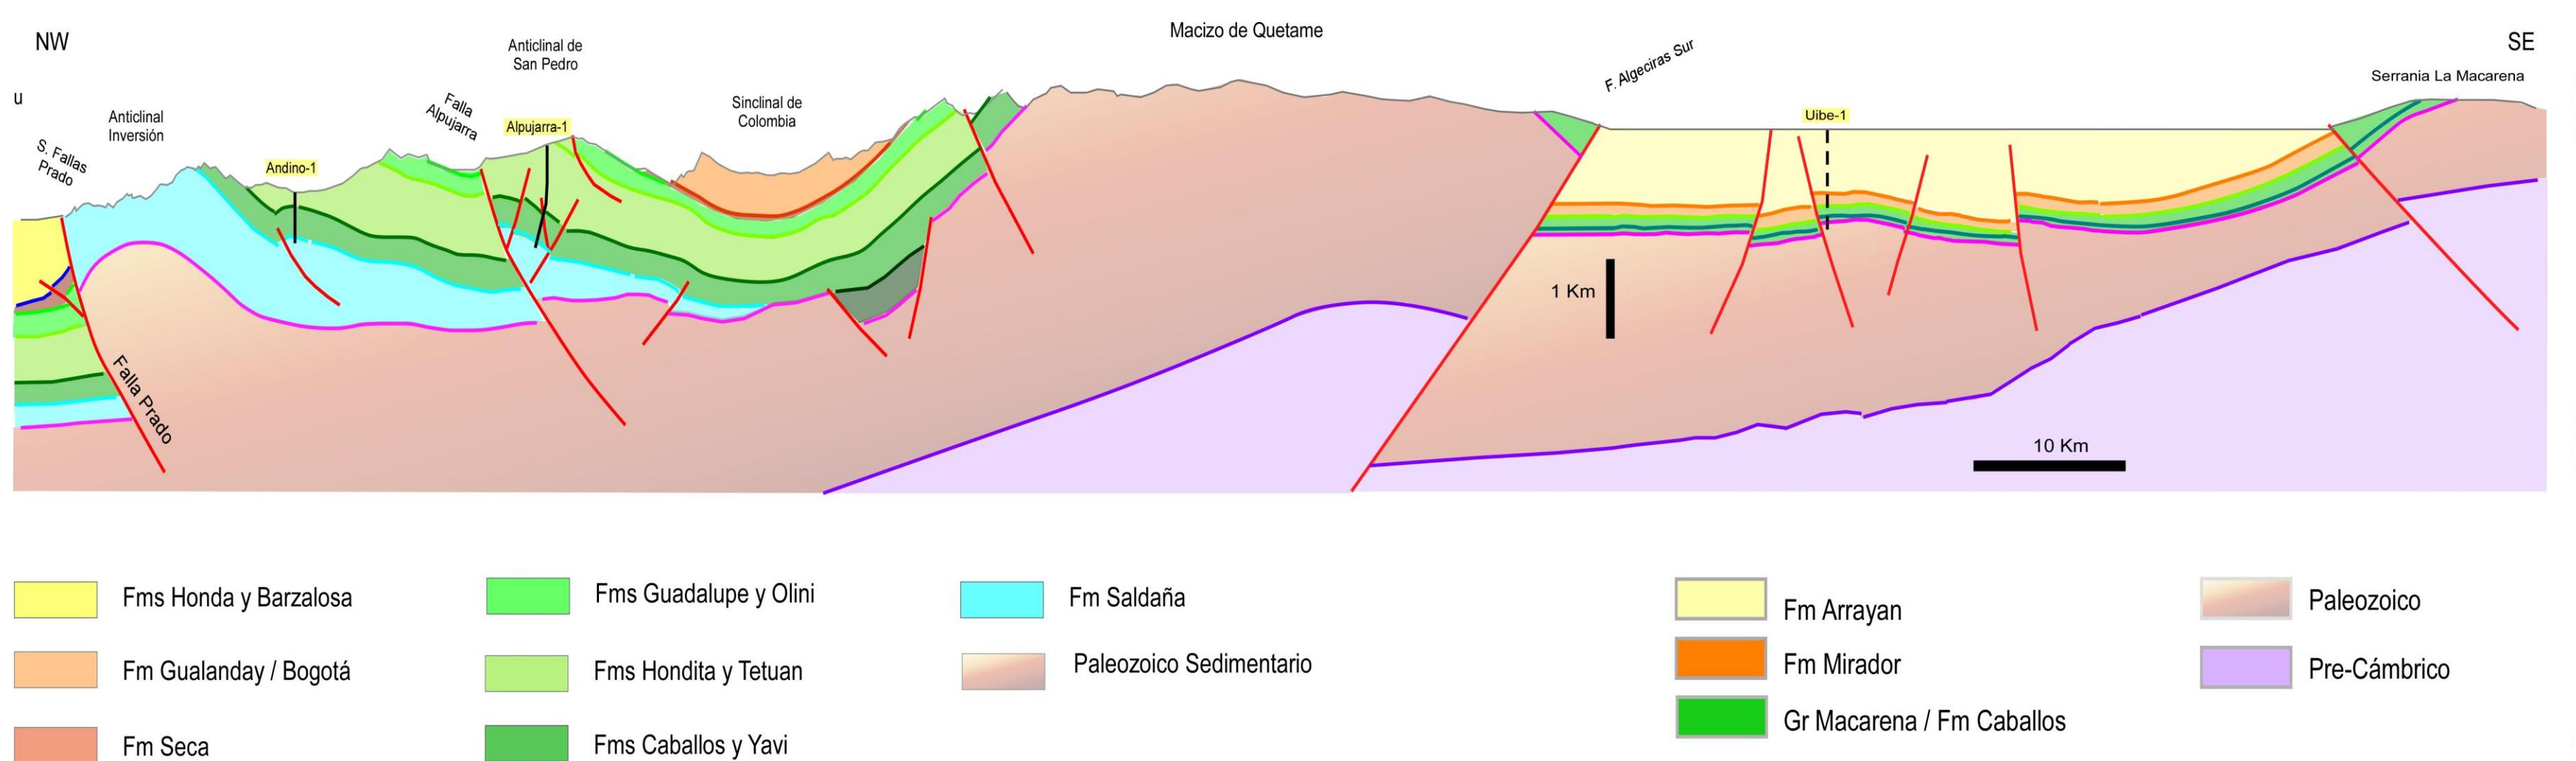

TRANSECT 3

- Highly deformed area, where the **Capella oil field** was discovered.
- **Inverted faults** with presence of basal conglomerates in restricted areas.

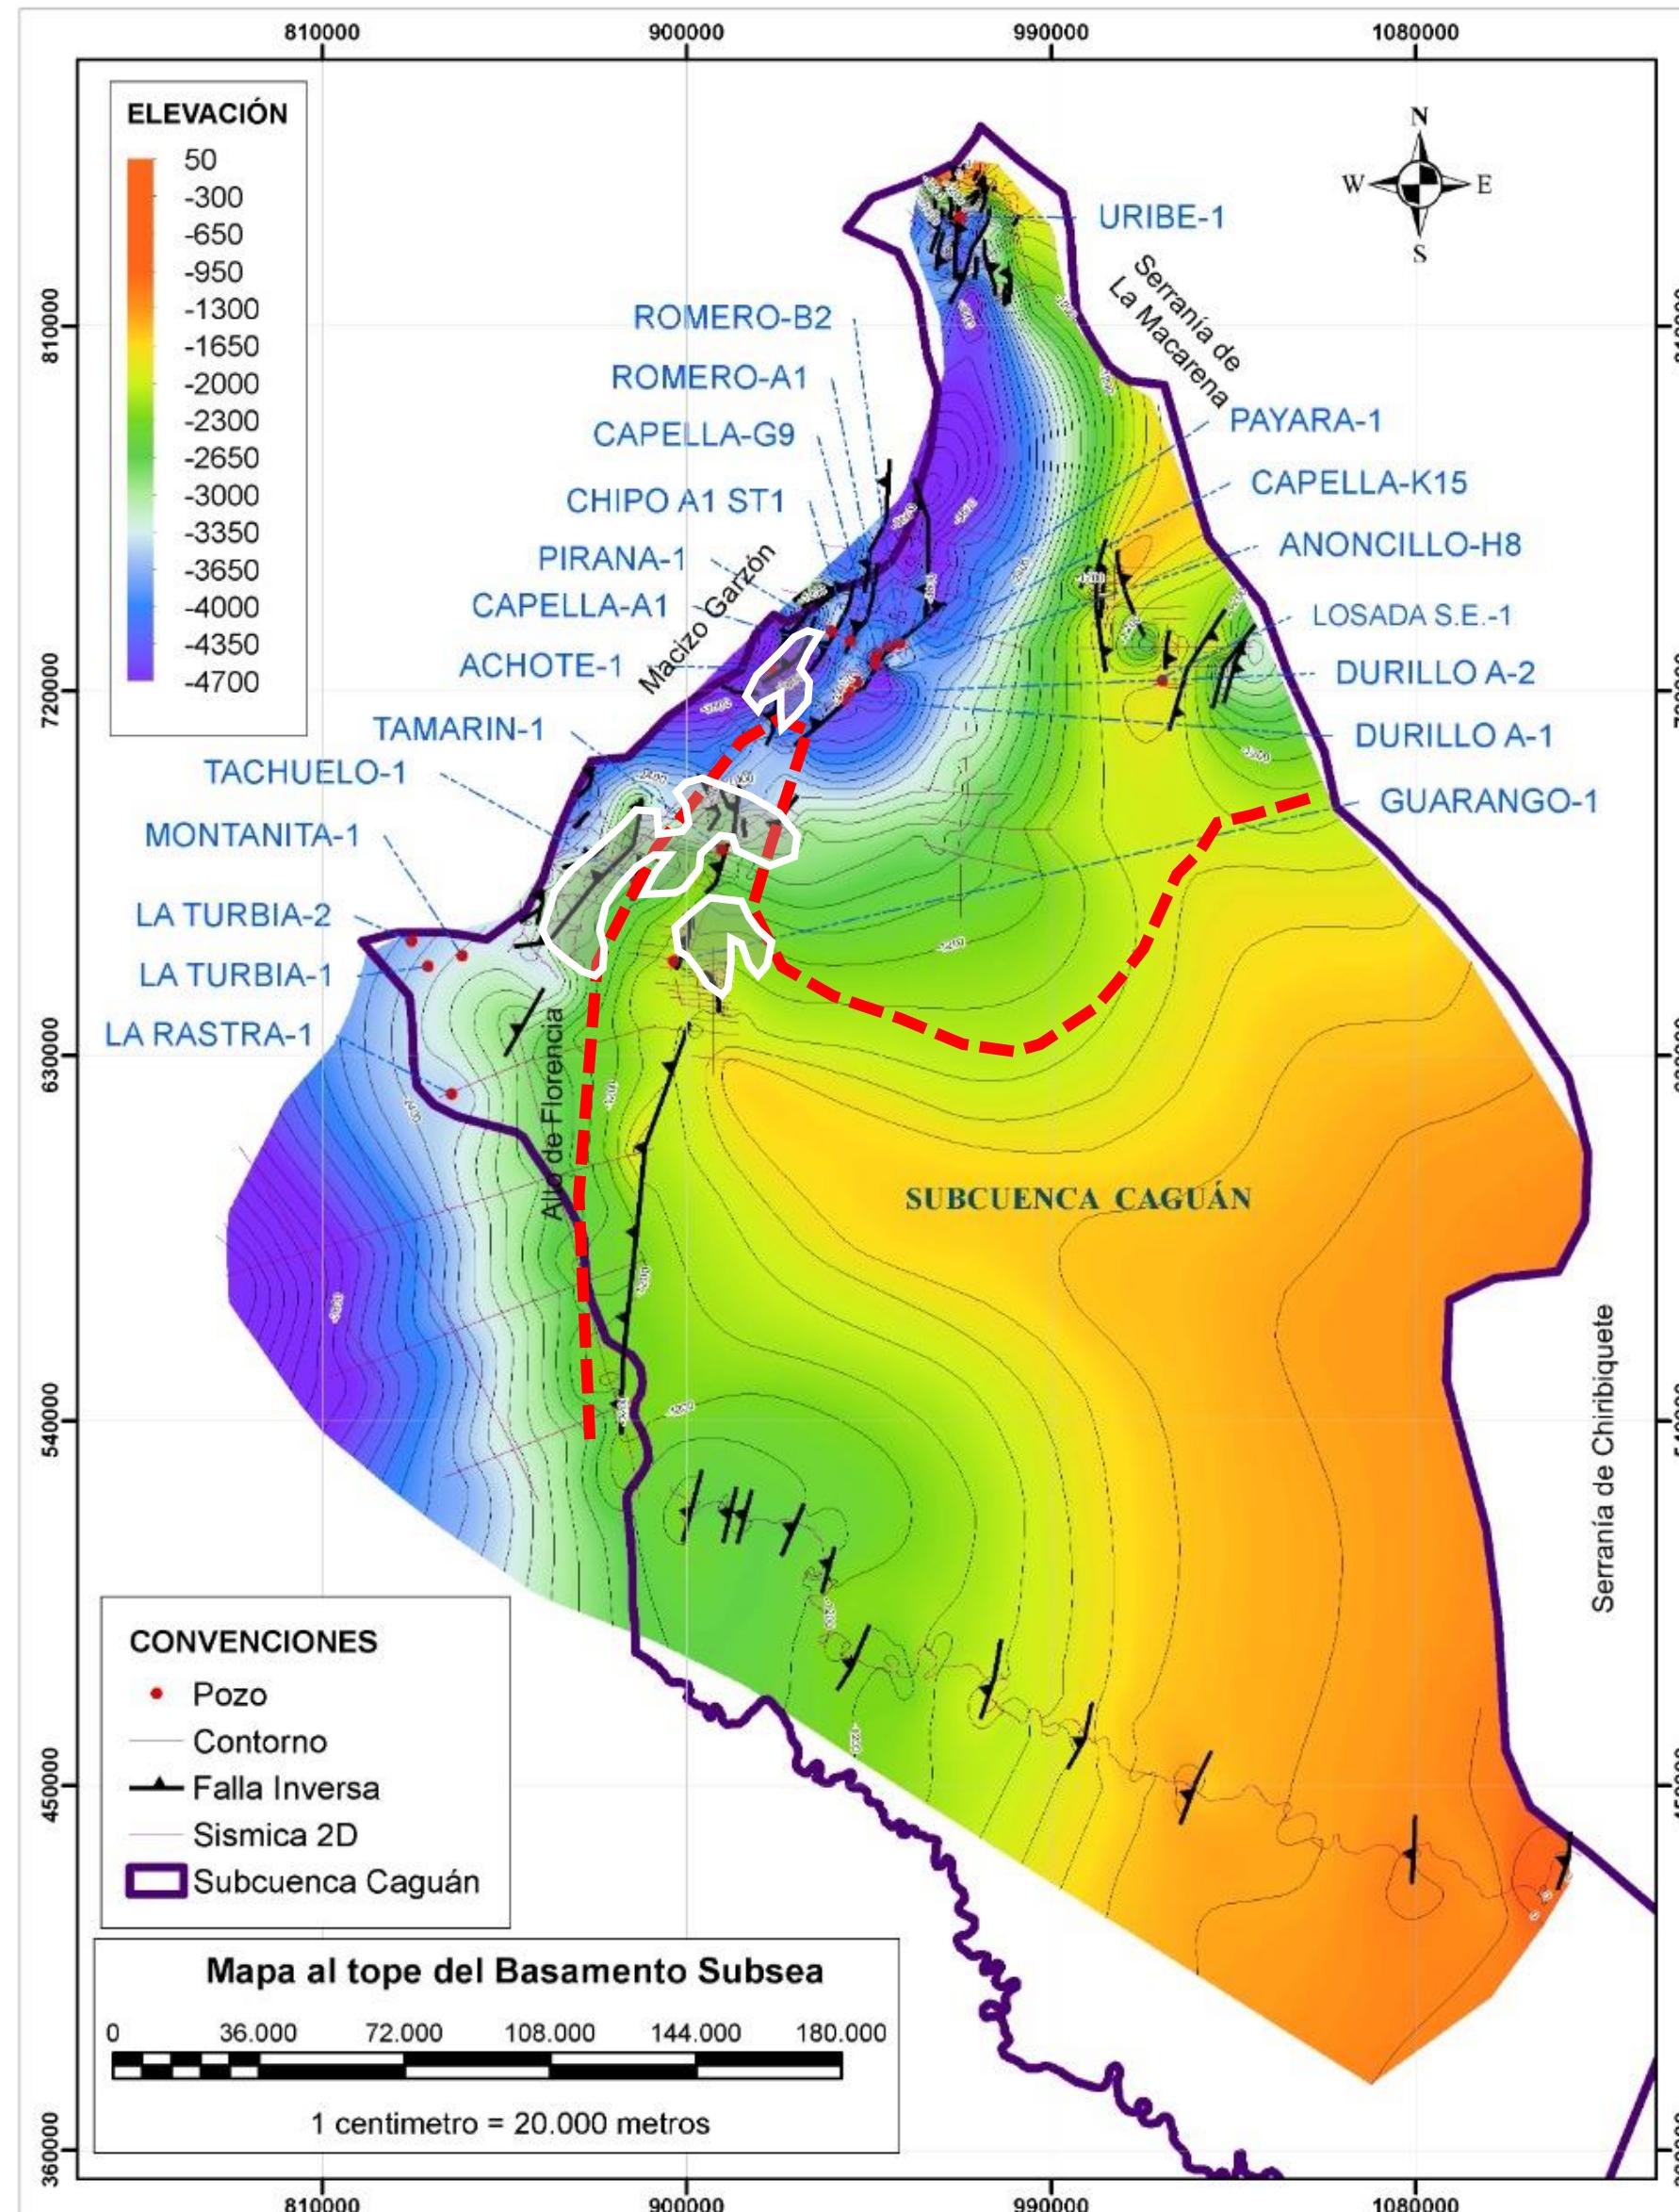

TRANSECT 4

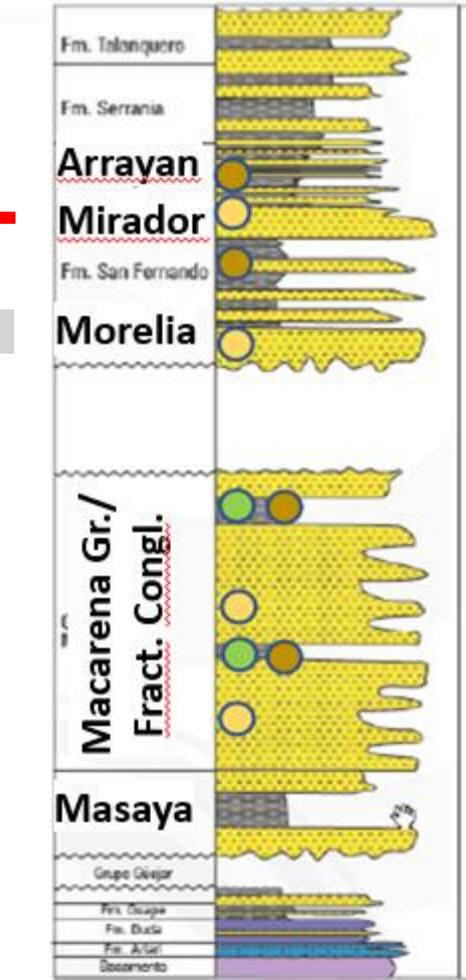

- Cretaceous presence in the hanging wall of the major Algeciras Fault, proves the **connection between Caguan and Eastern Cordillera**
- **Steep inverse faults** are present in the northern part of Caguan, also affected by the uplift of La Macarena.

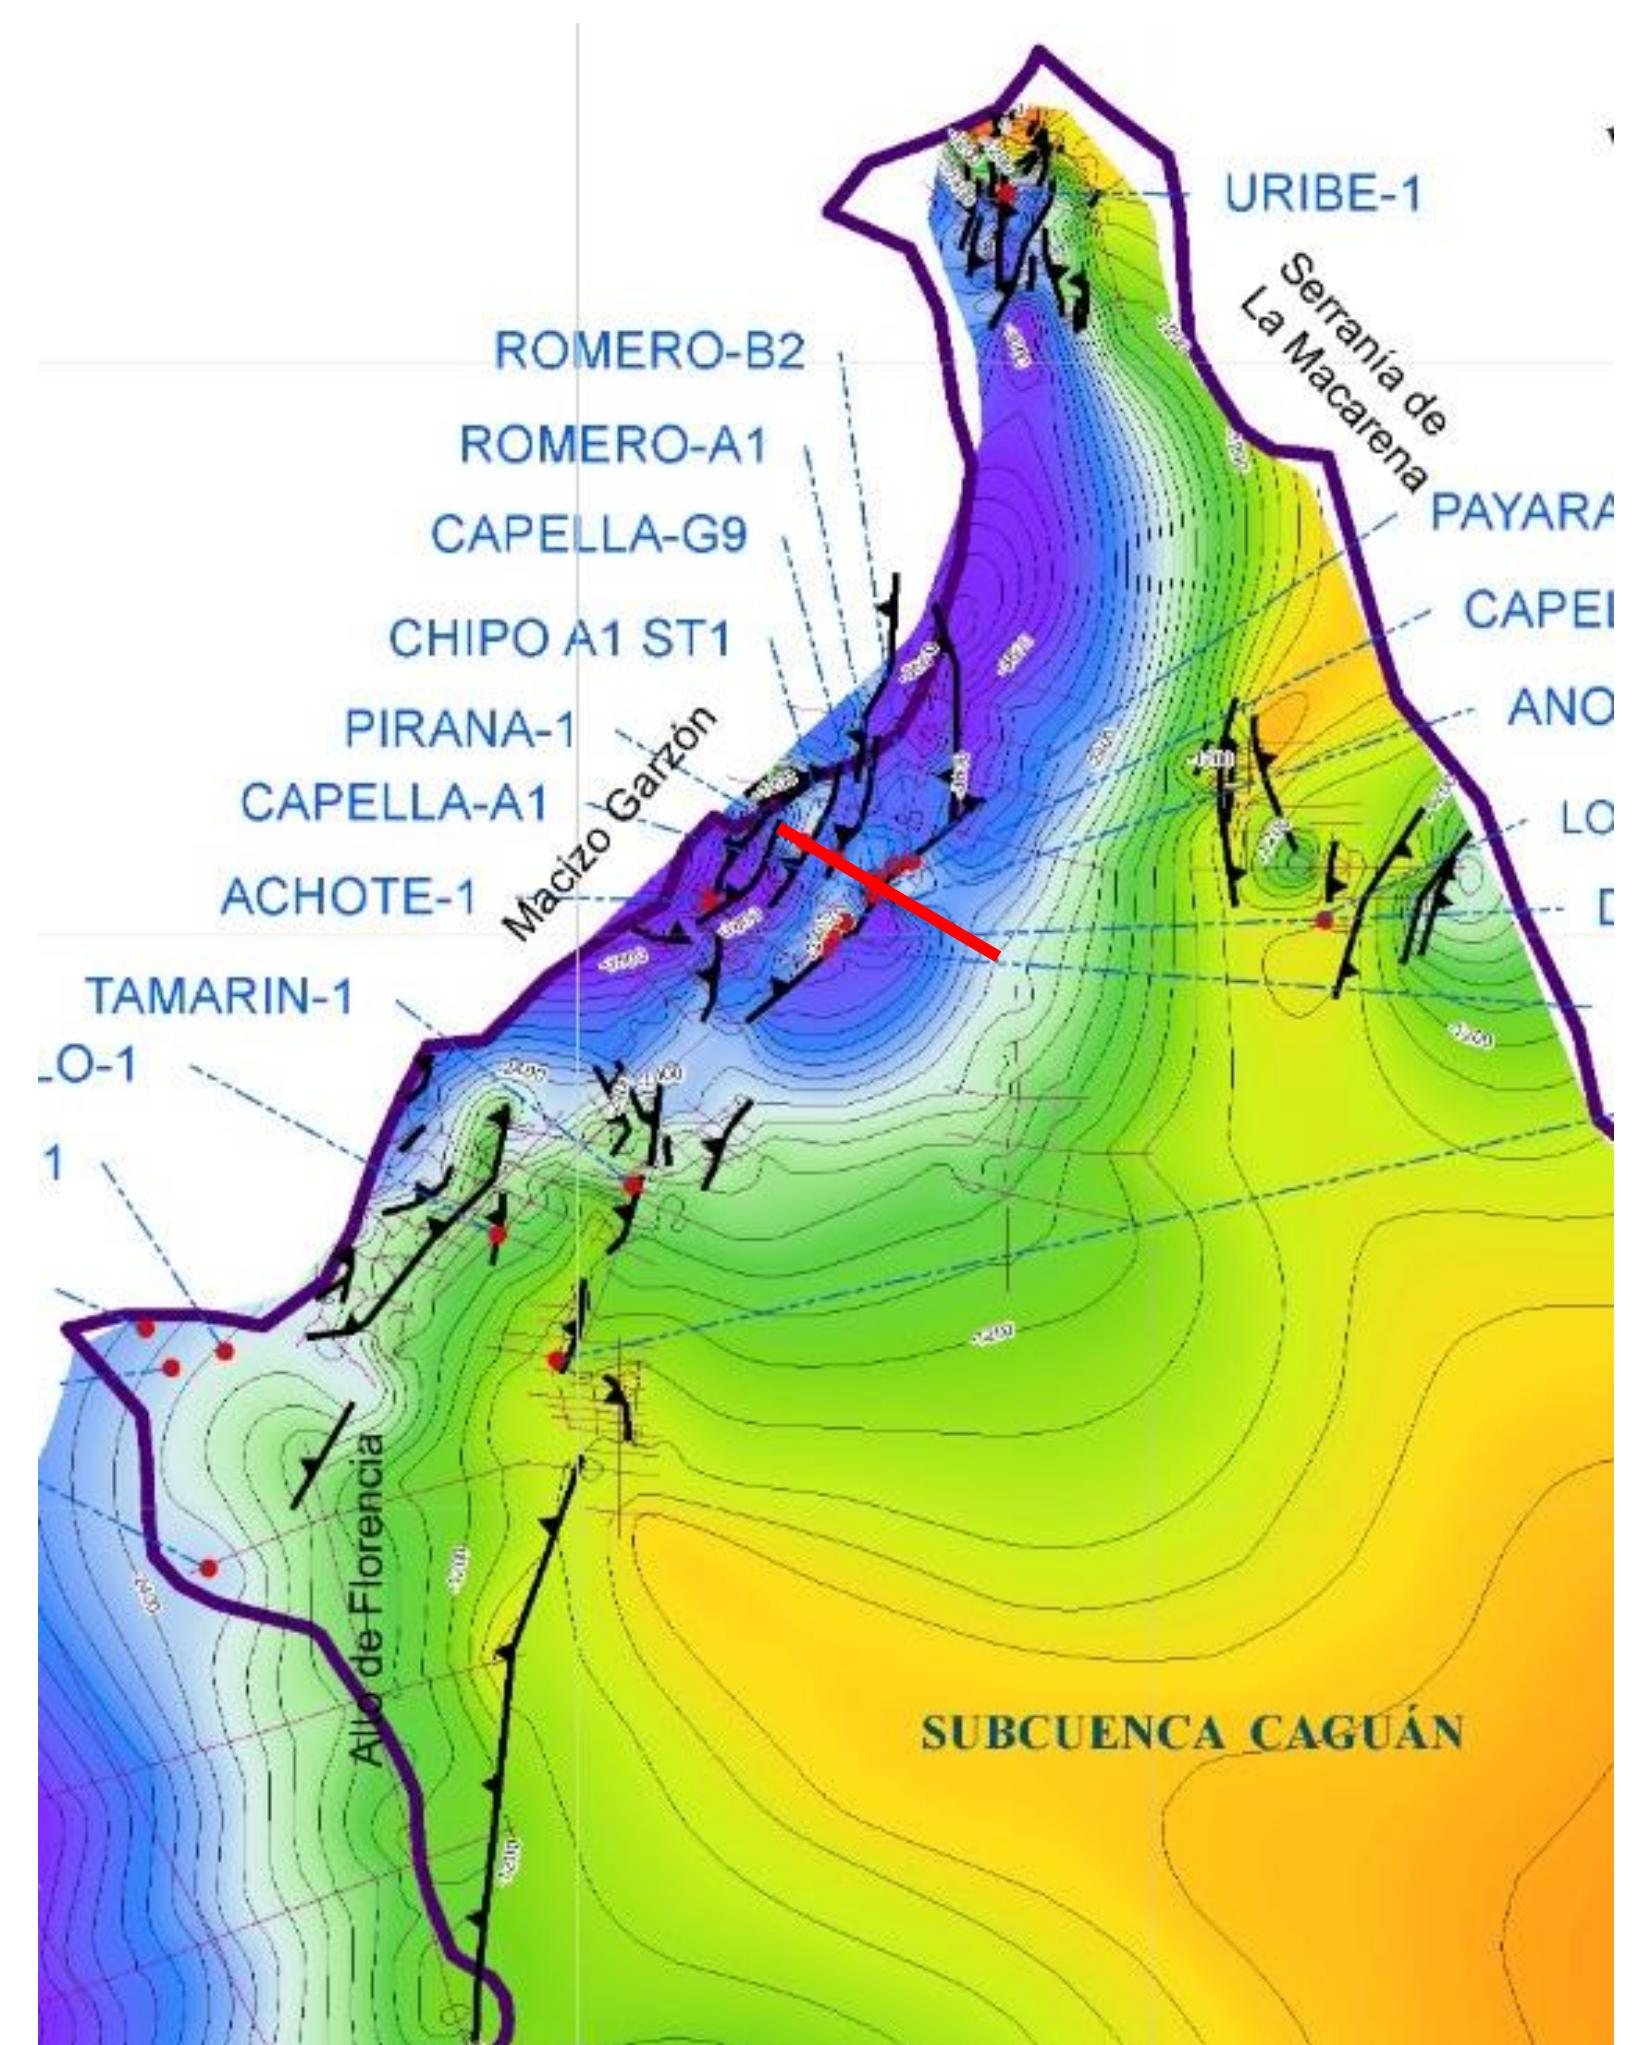

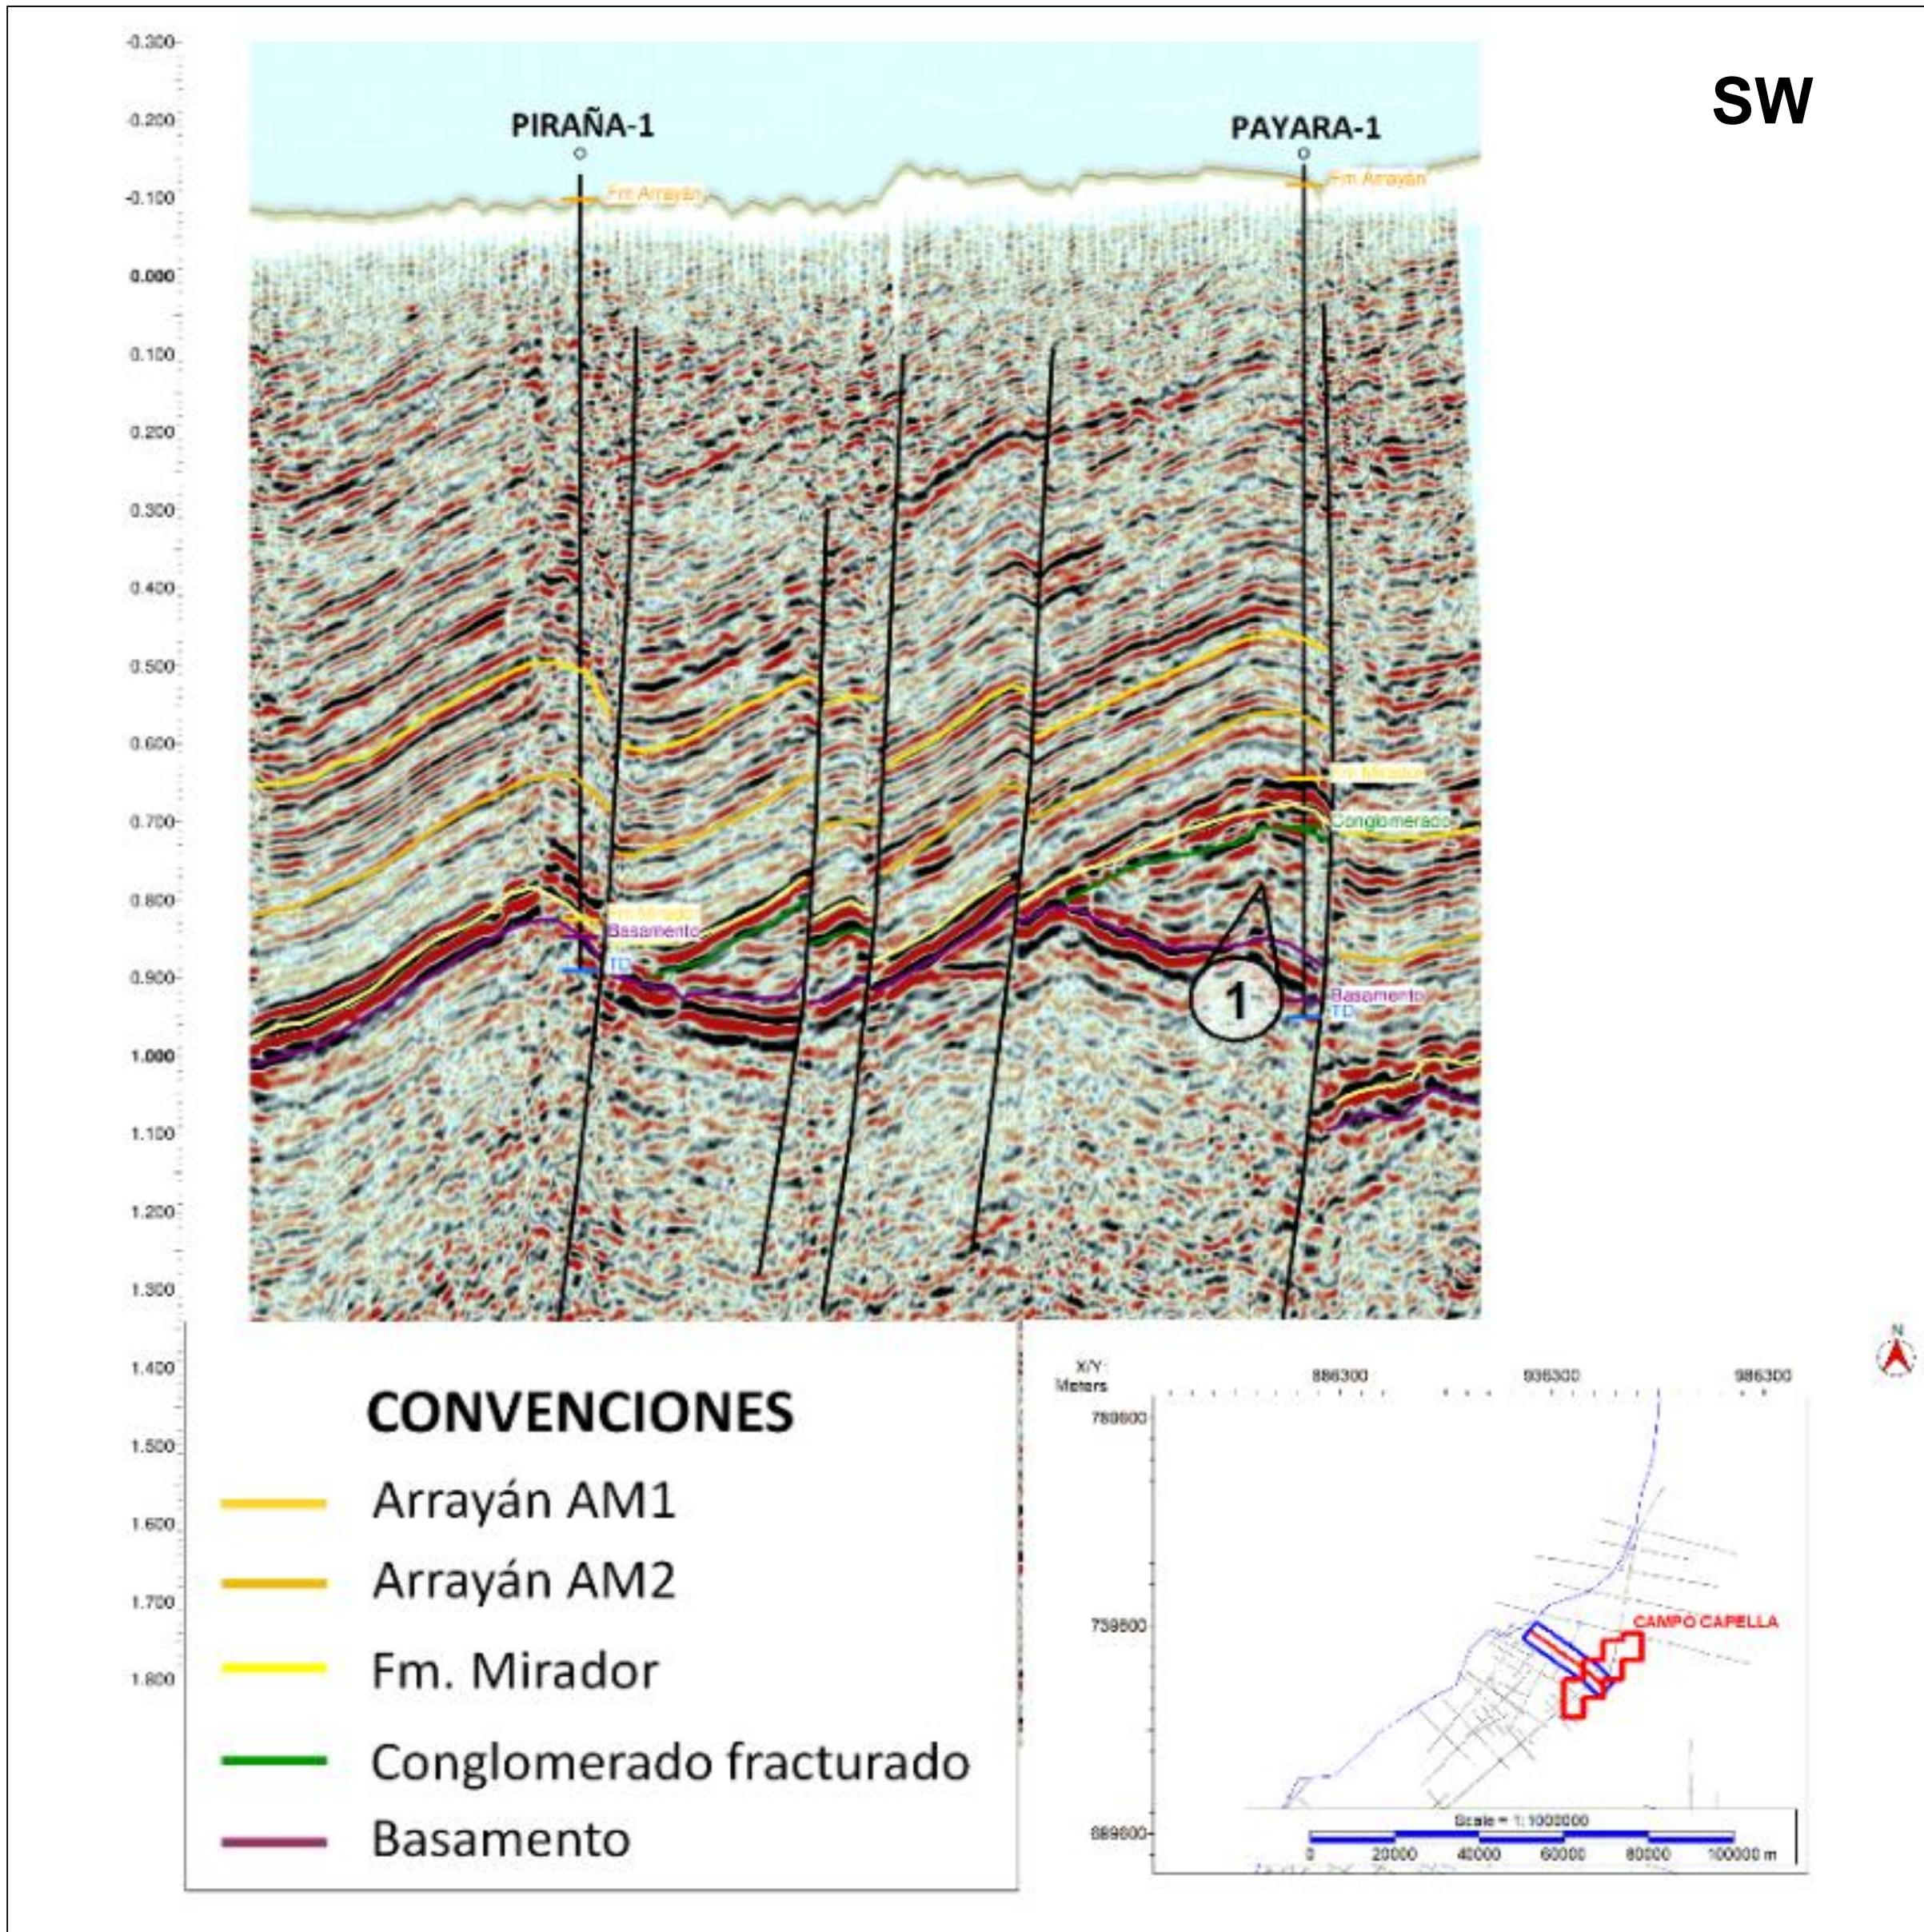

BASEMENT MAP

- **Foreland basin** dipping to the West.
- **Deformation** of the basin is higher in the areas **close to the Eastern Cordillera** foothills and La Macarena high.
- Basement paleo-topography restricted the presence of reservoirs **Mirador and Morelia formations**.

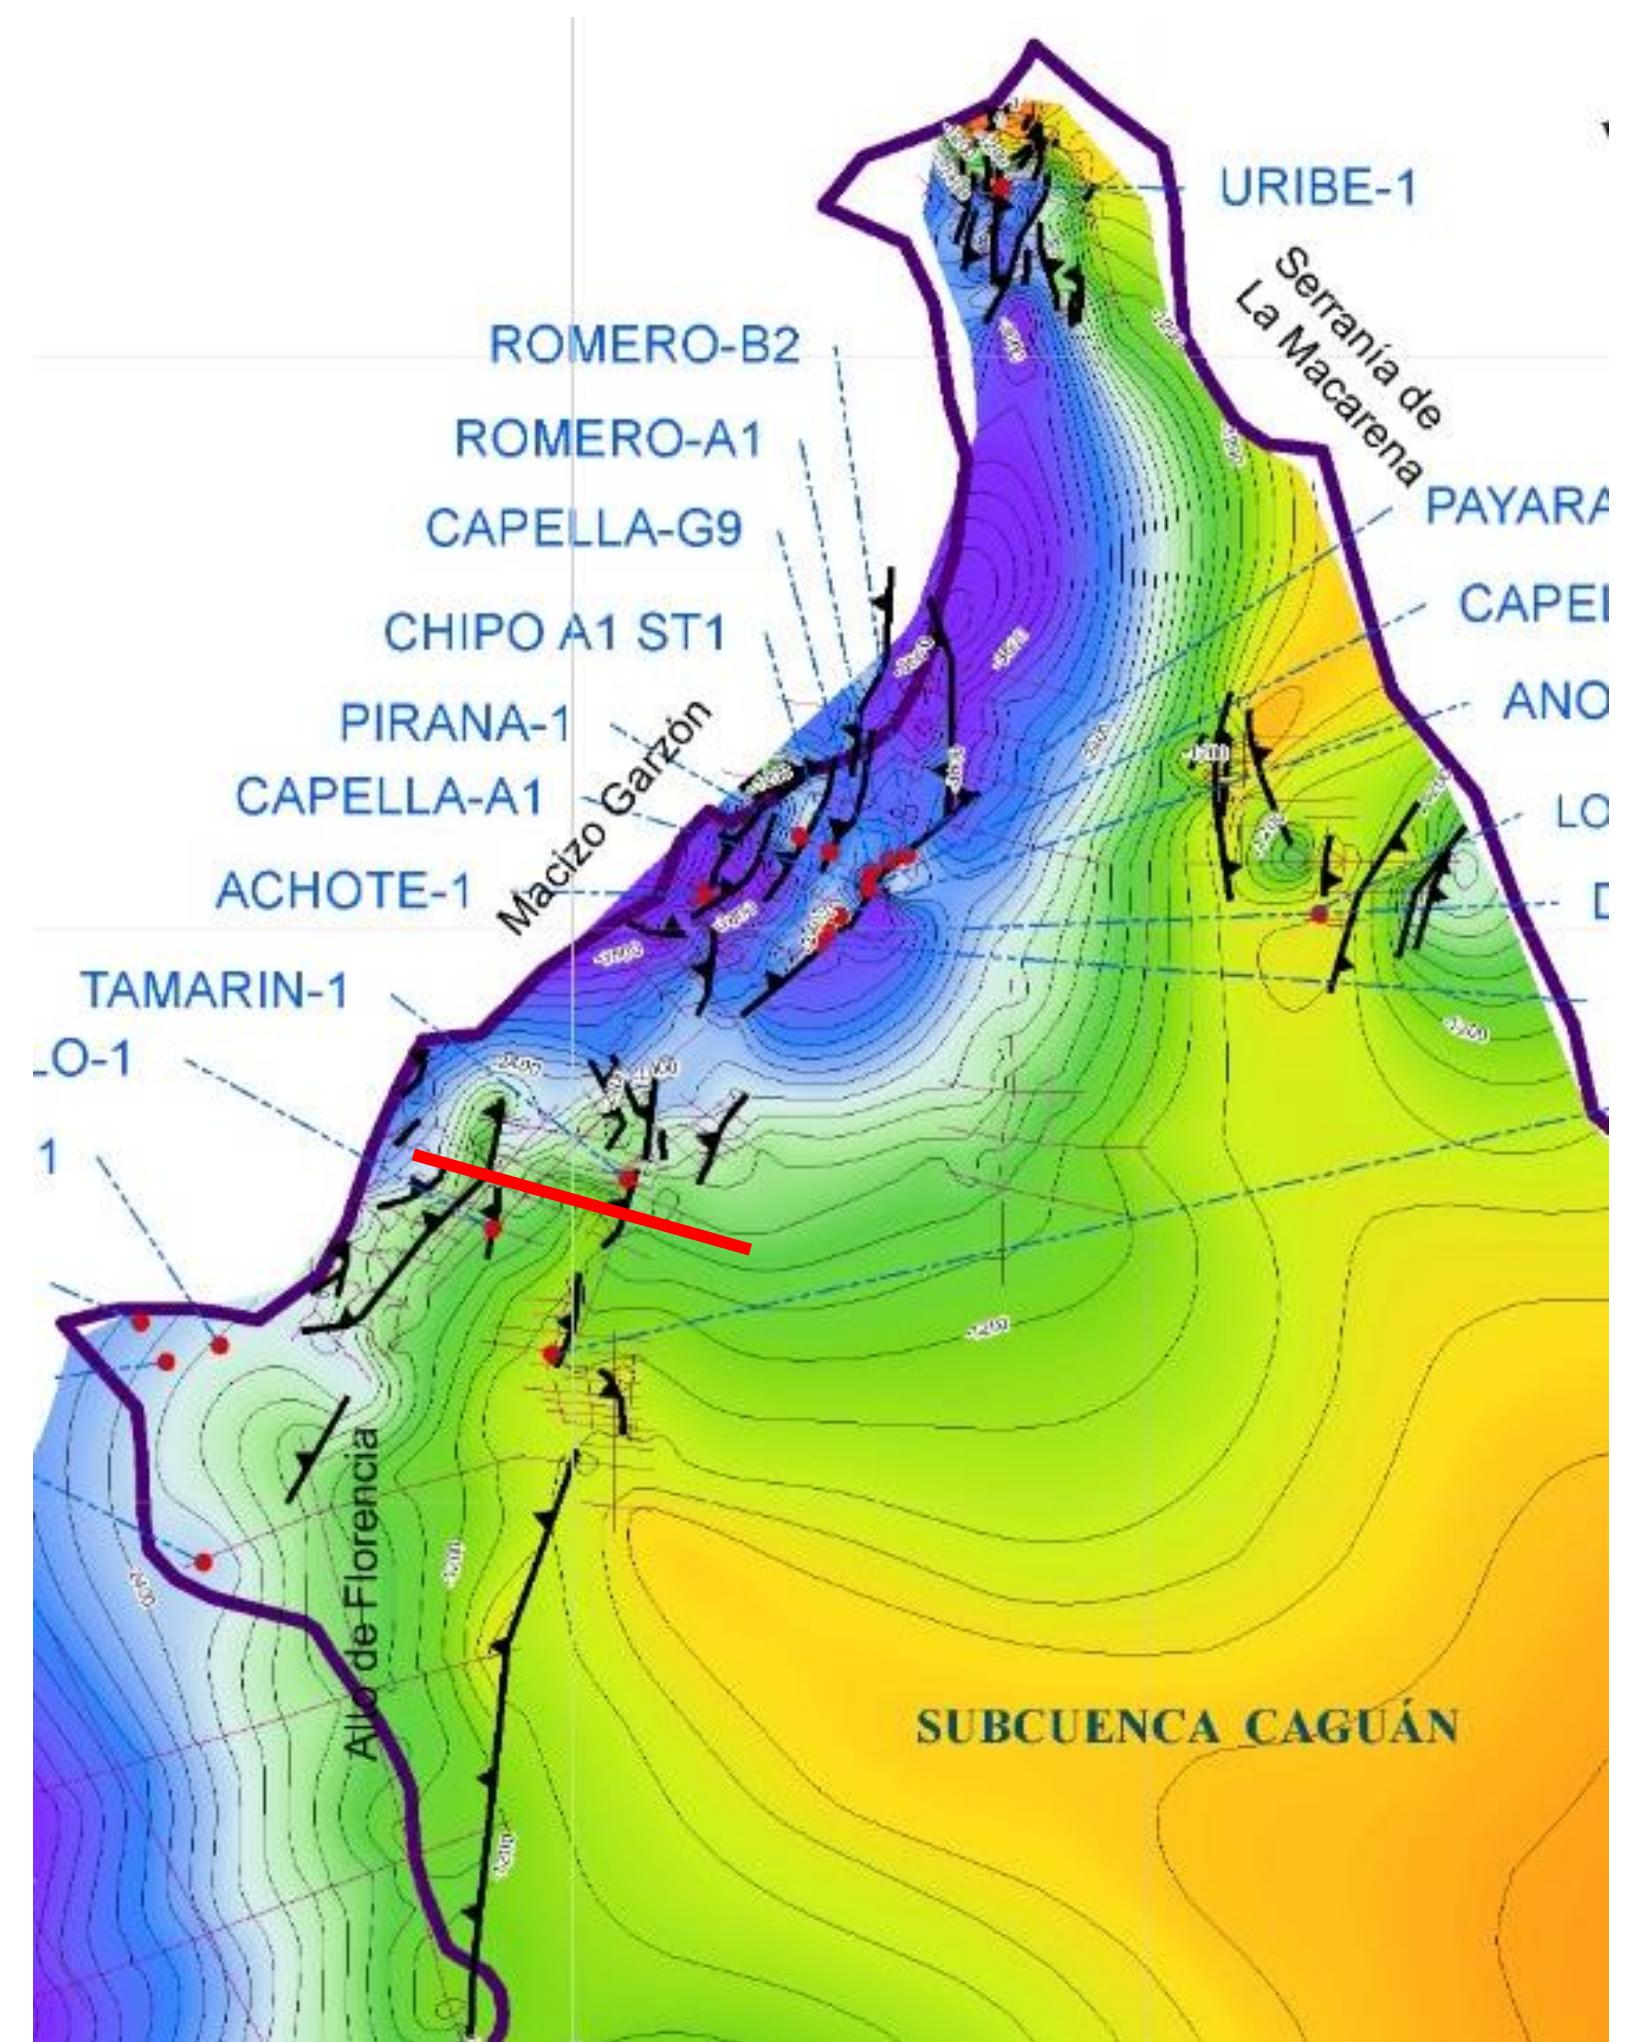

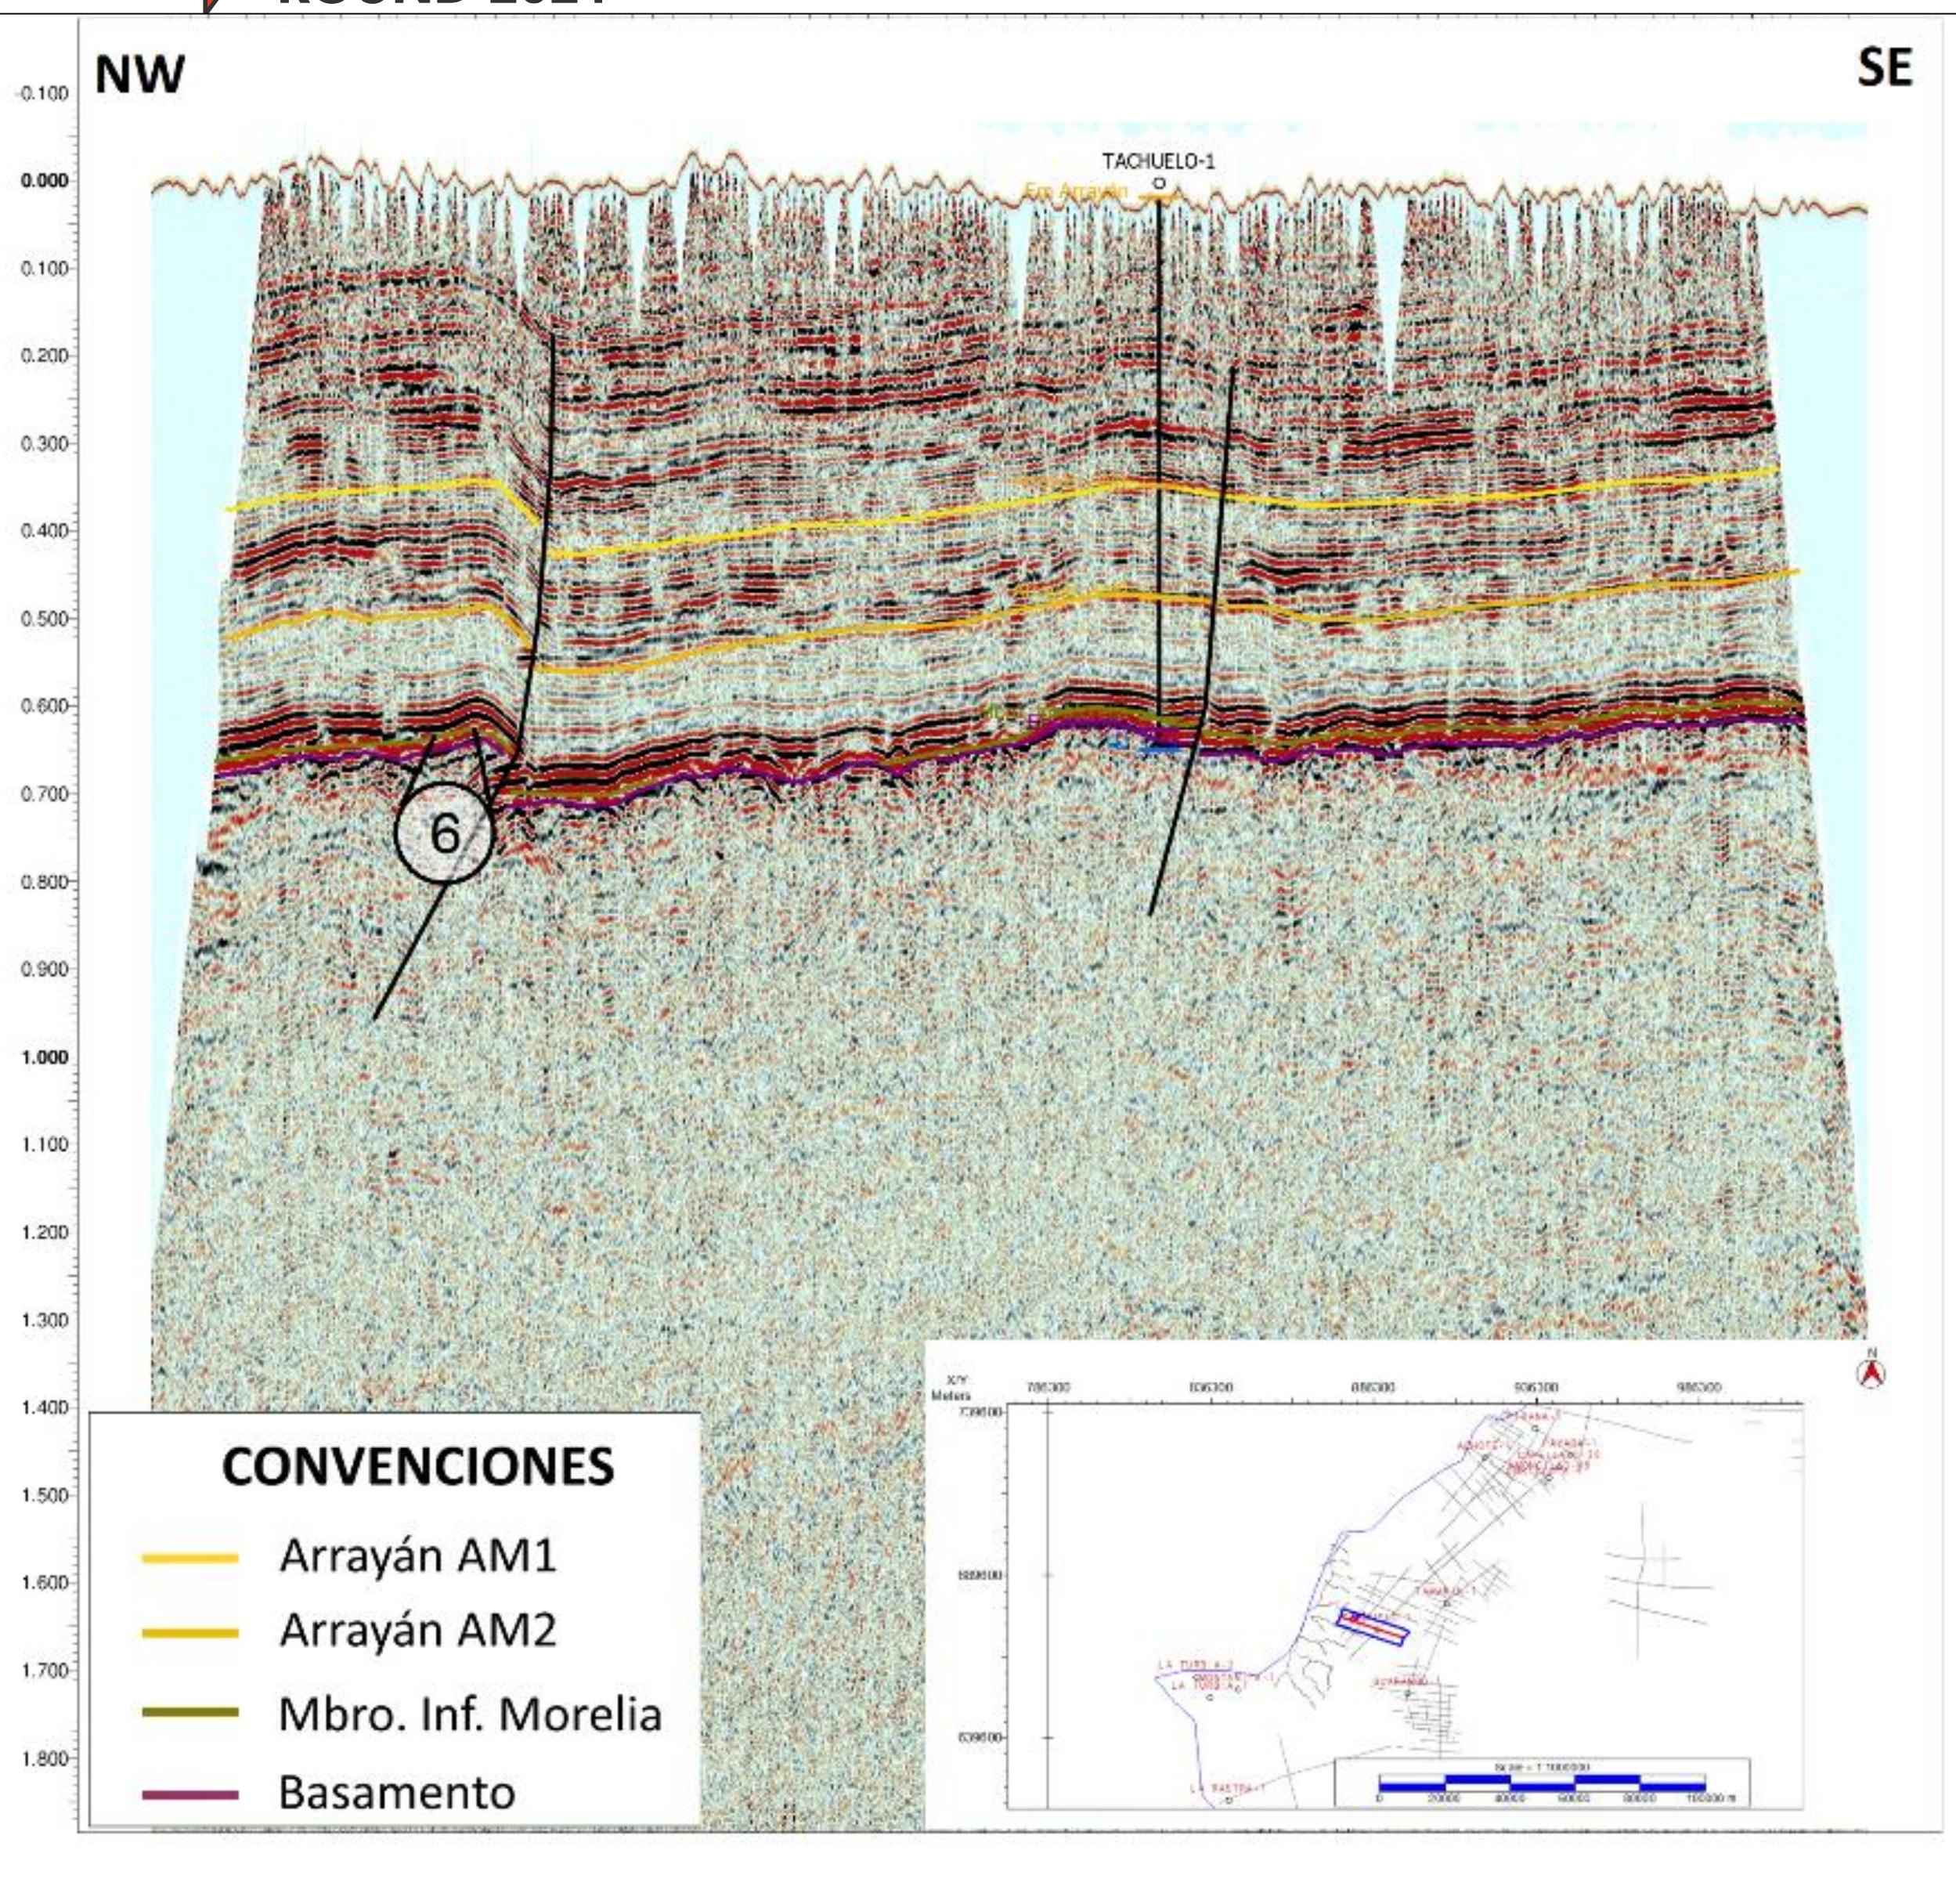

PROSPECTIVITY

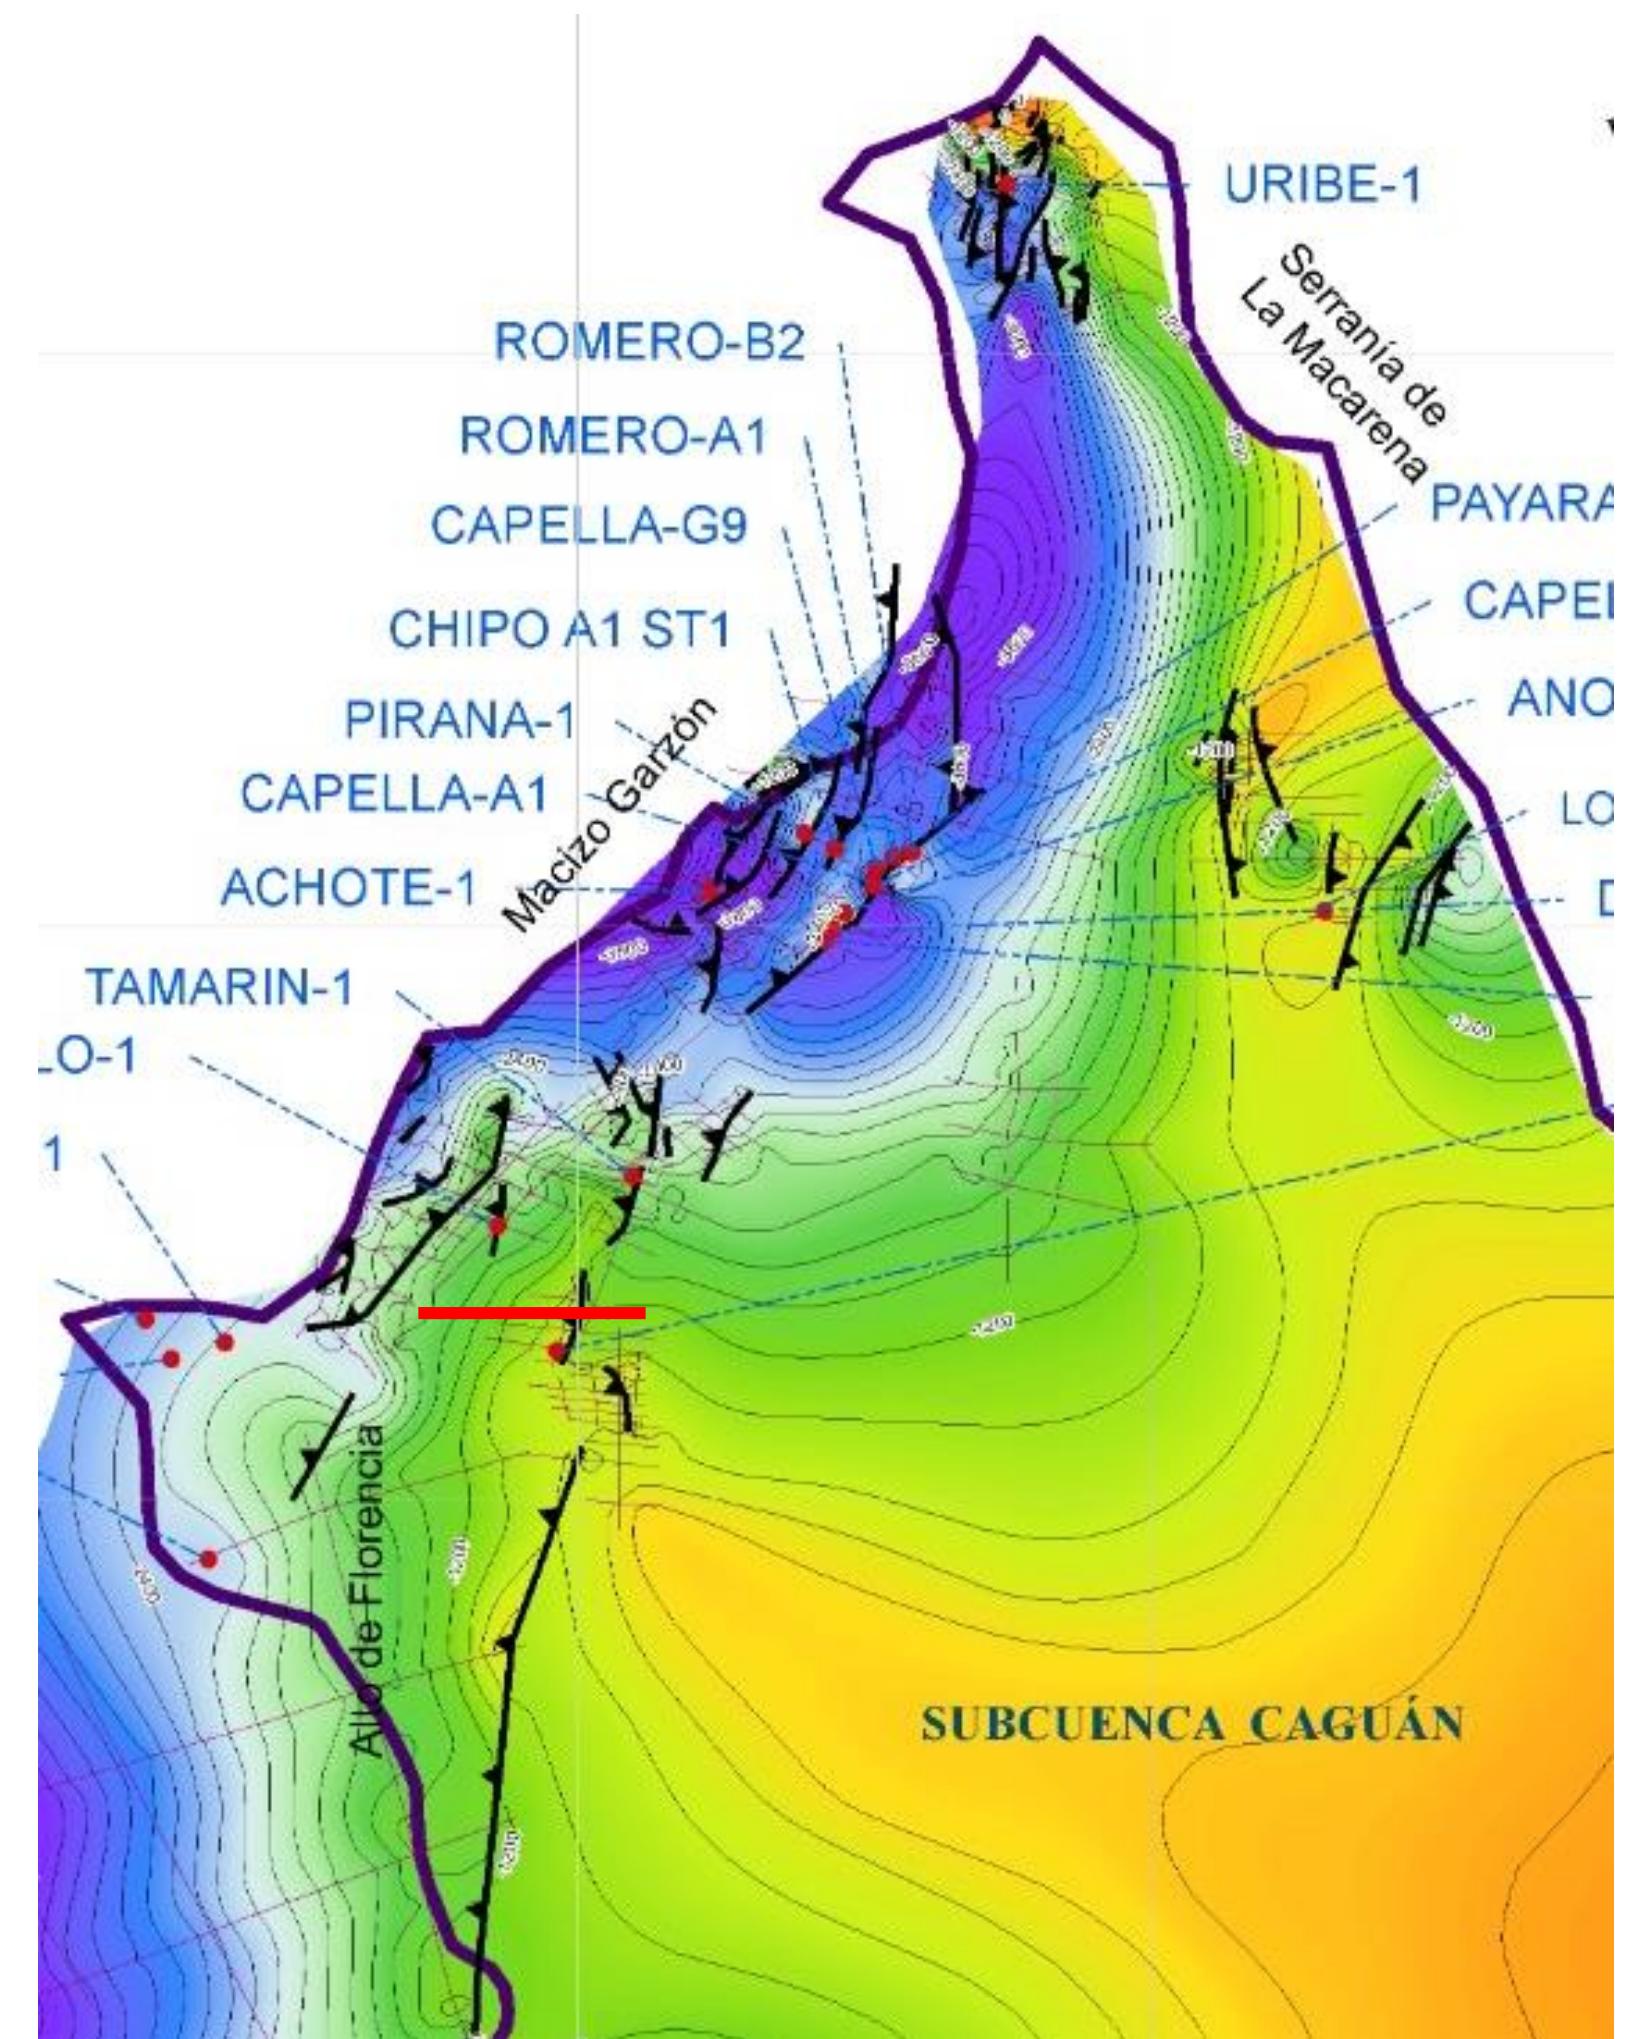

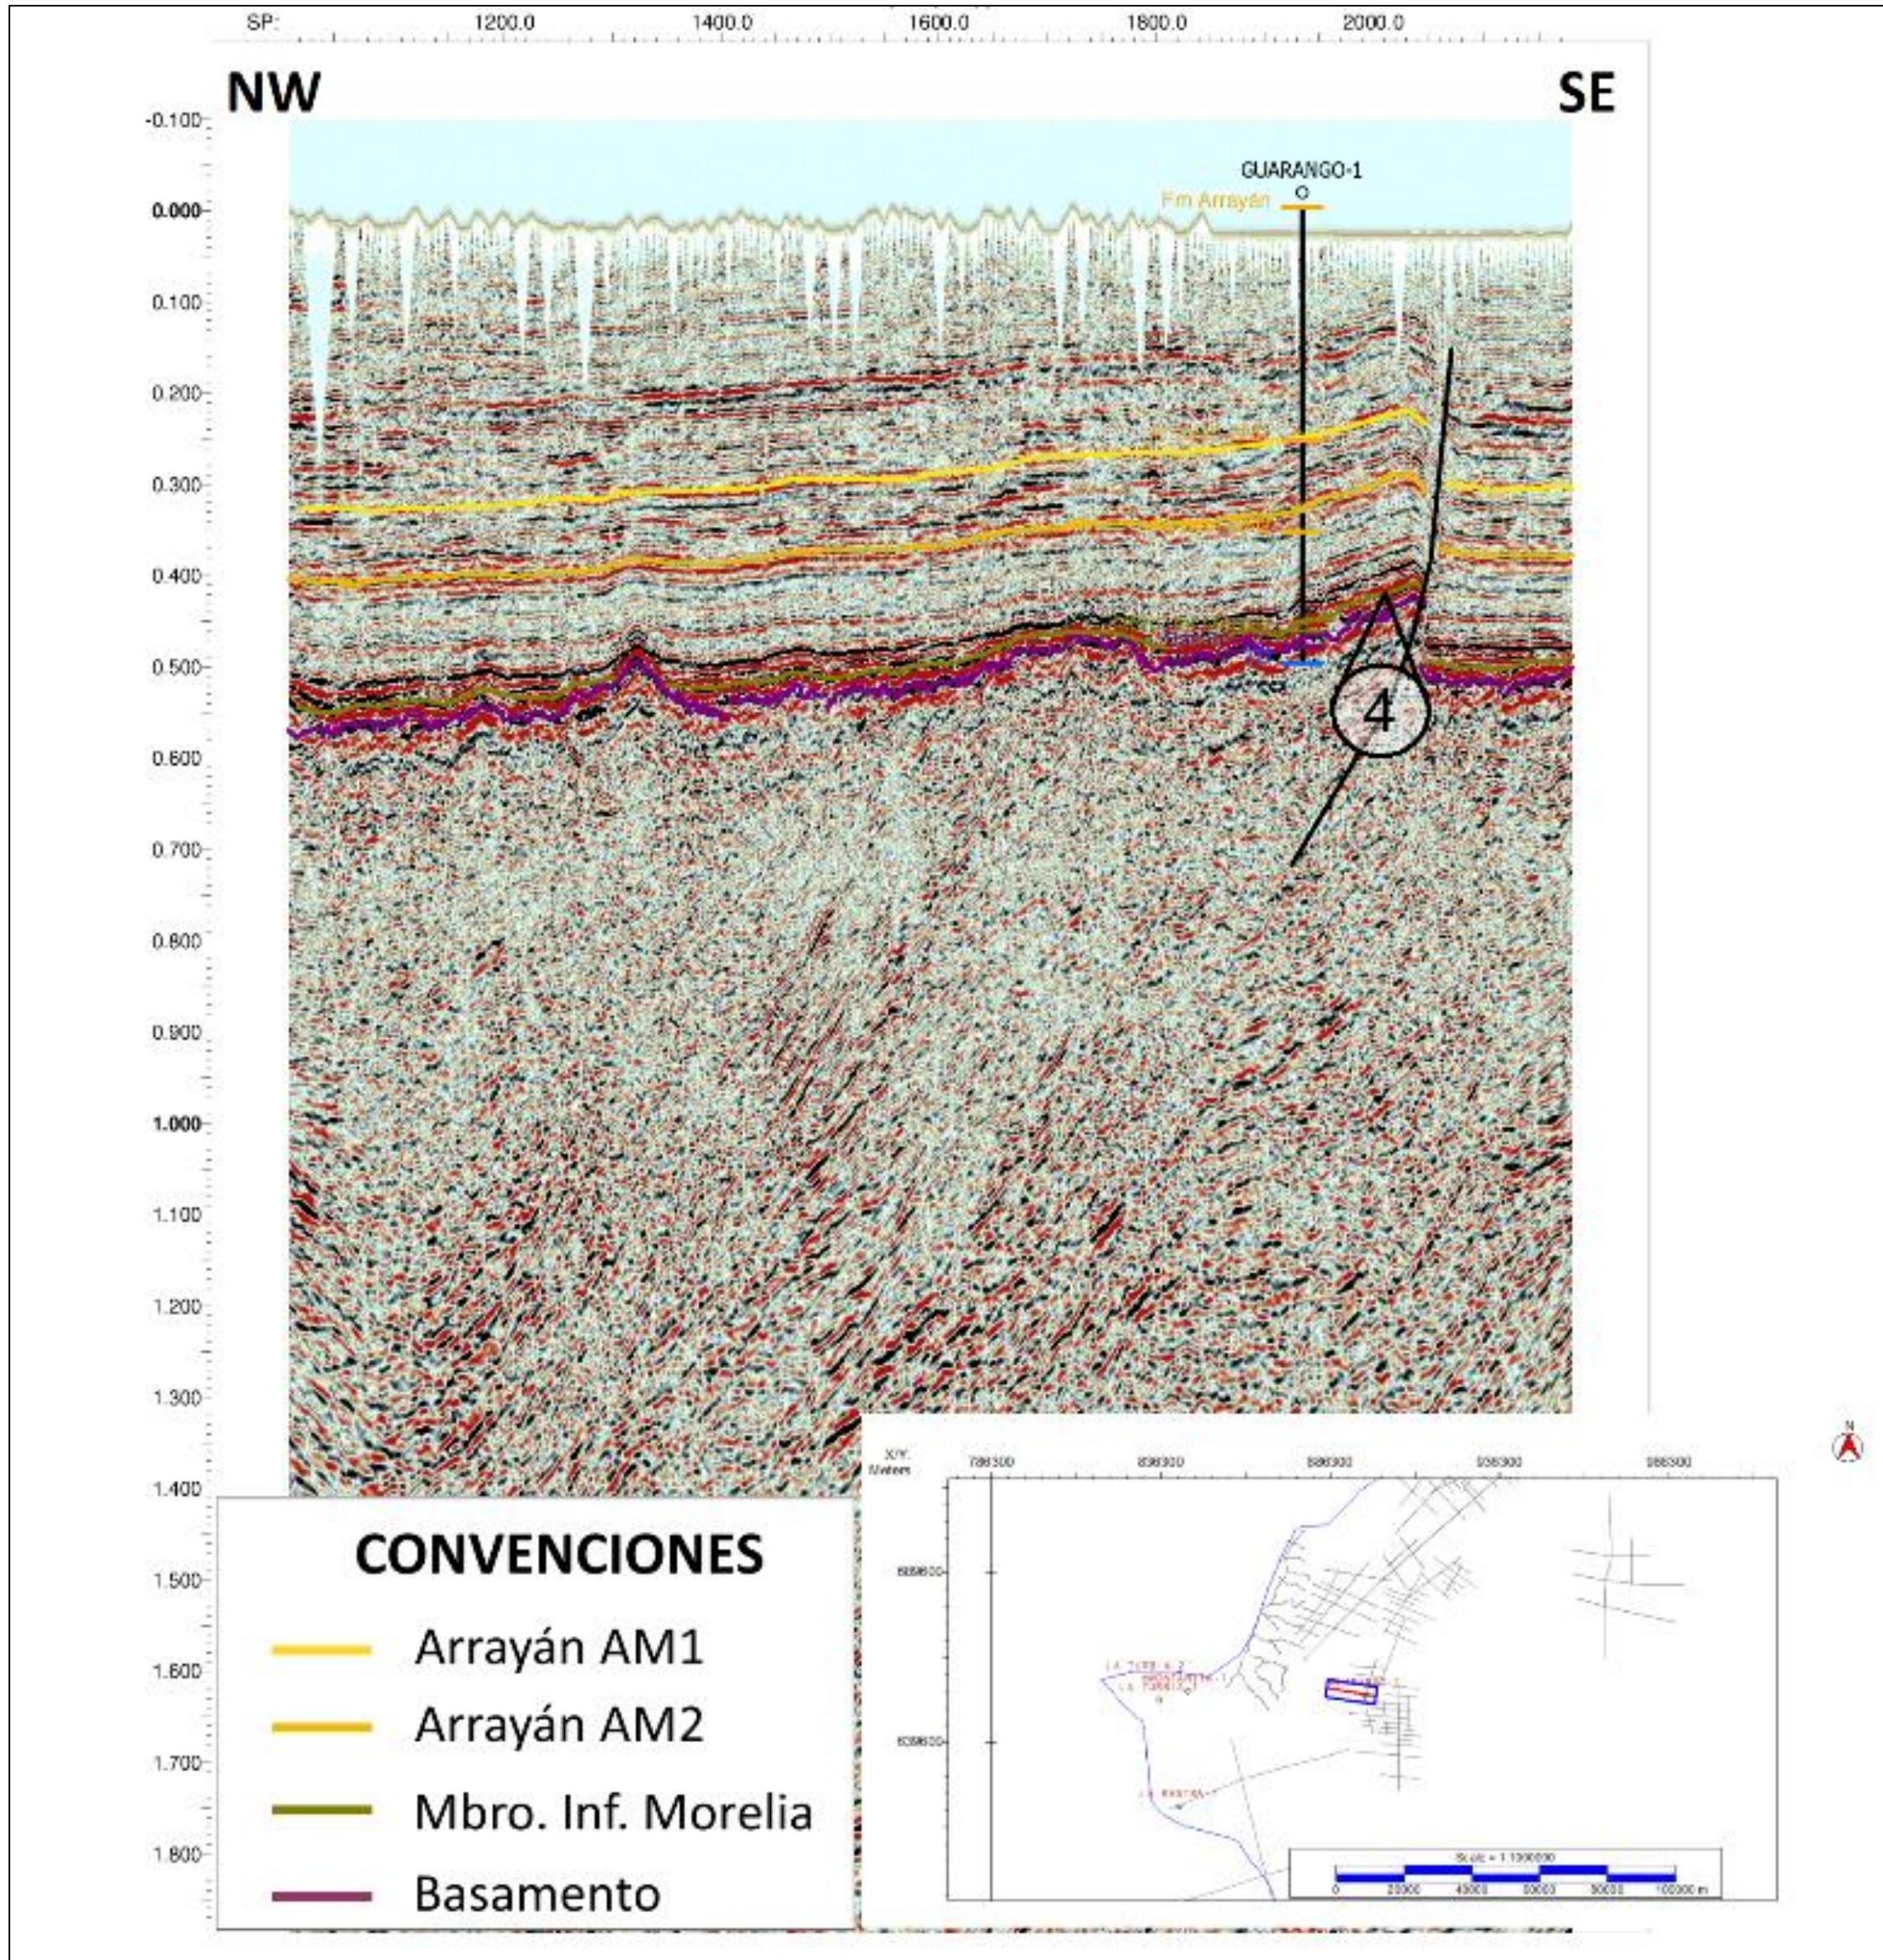

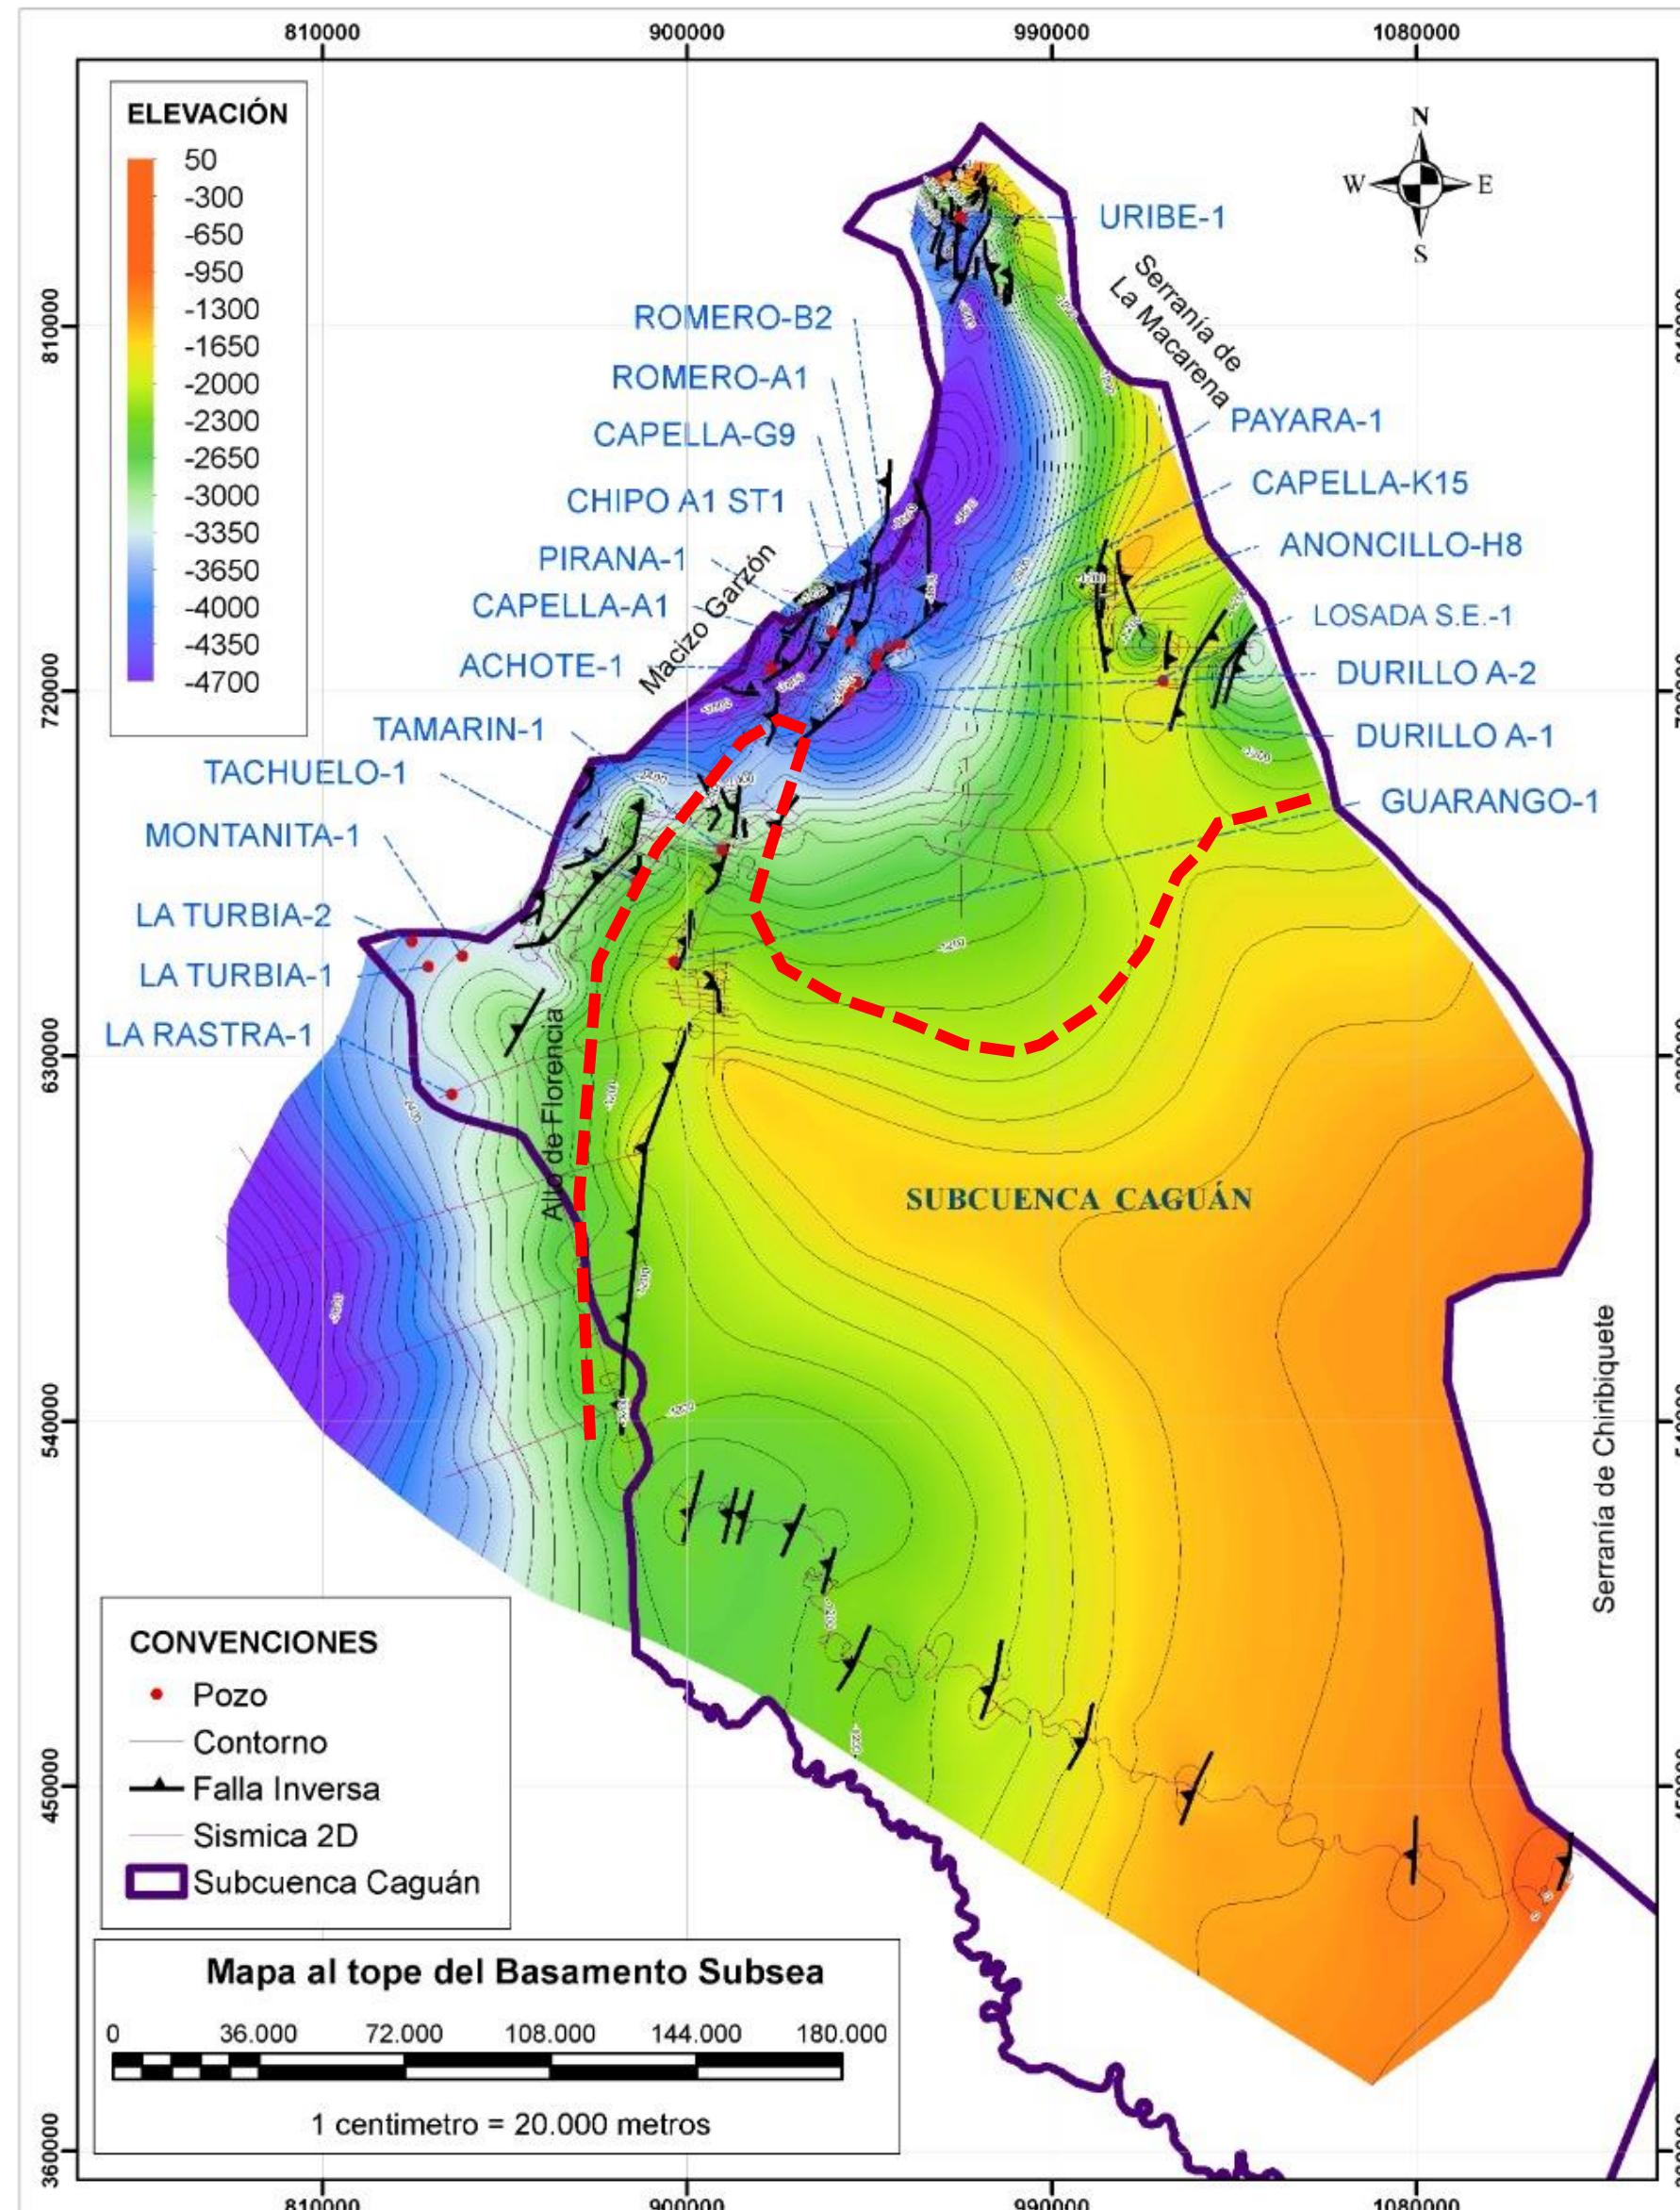

PROSPECTIVITY

PROSPECTIVITY

CONCLUSIONS

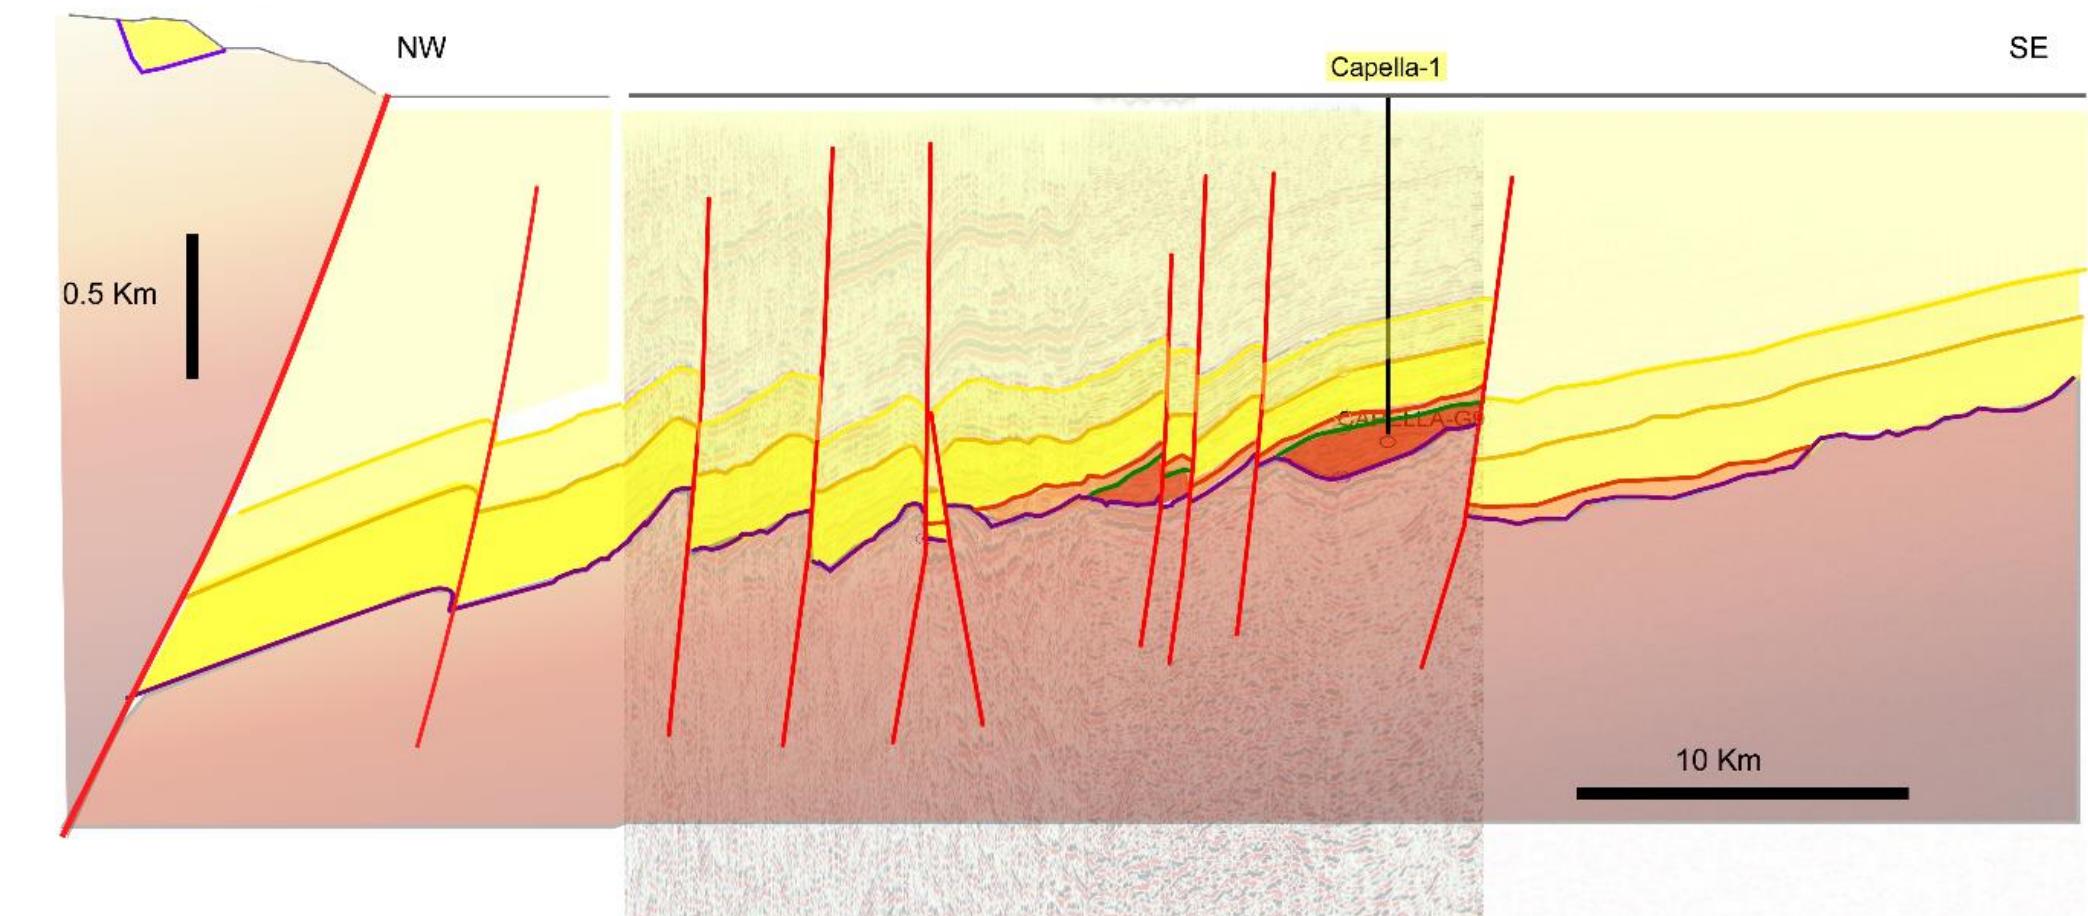

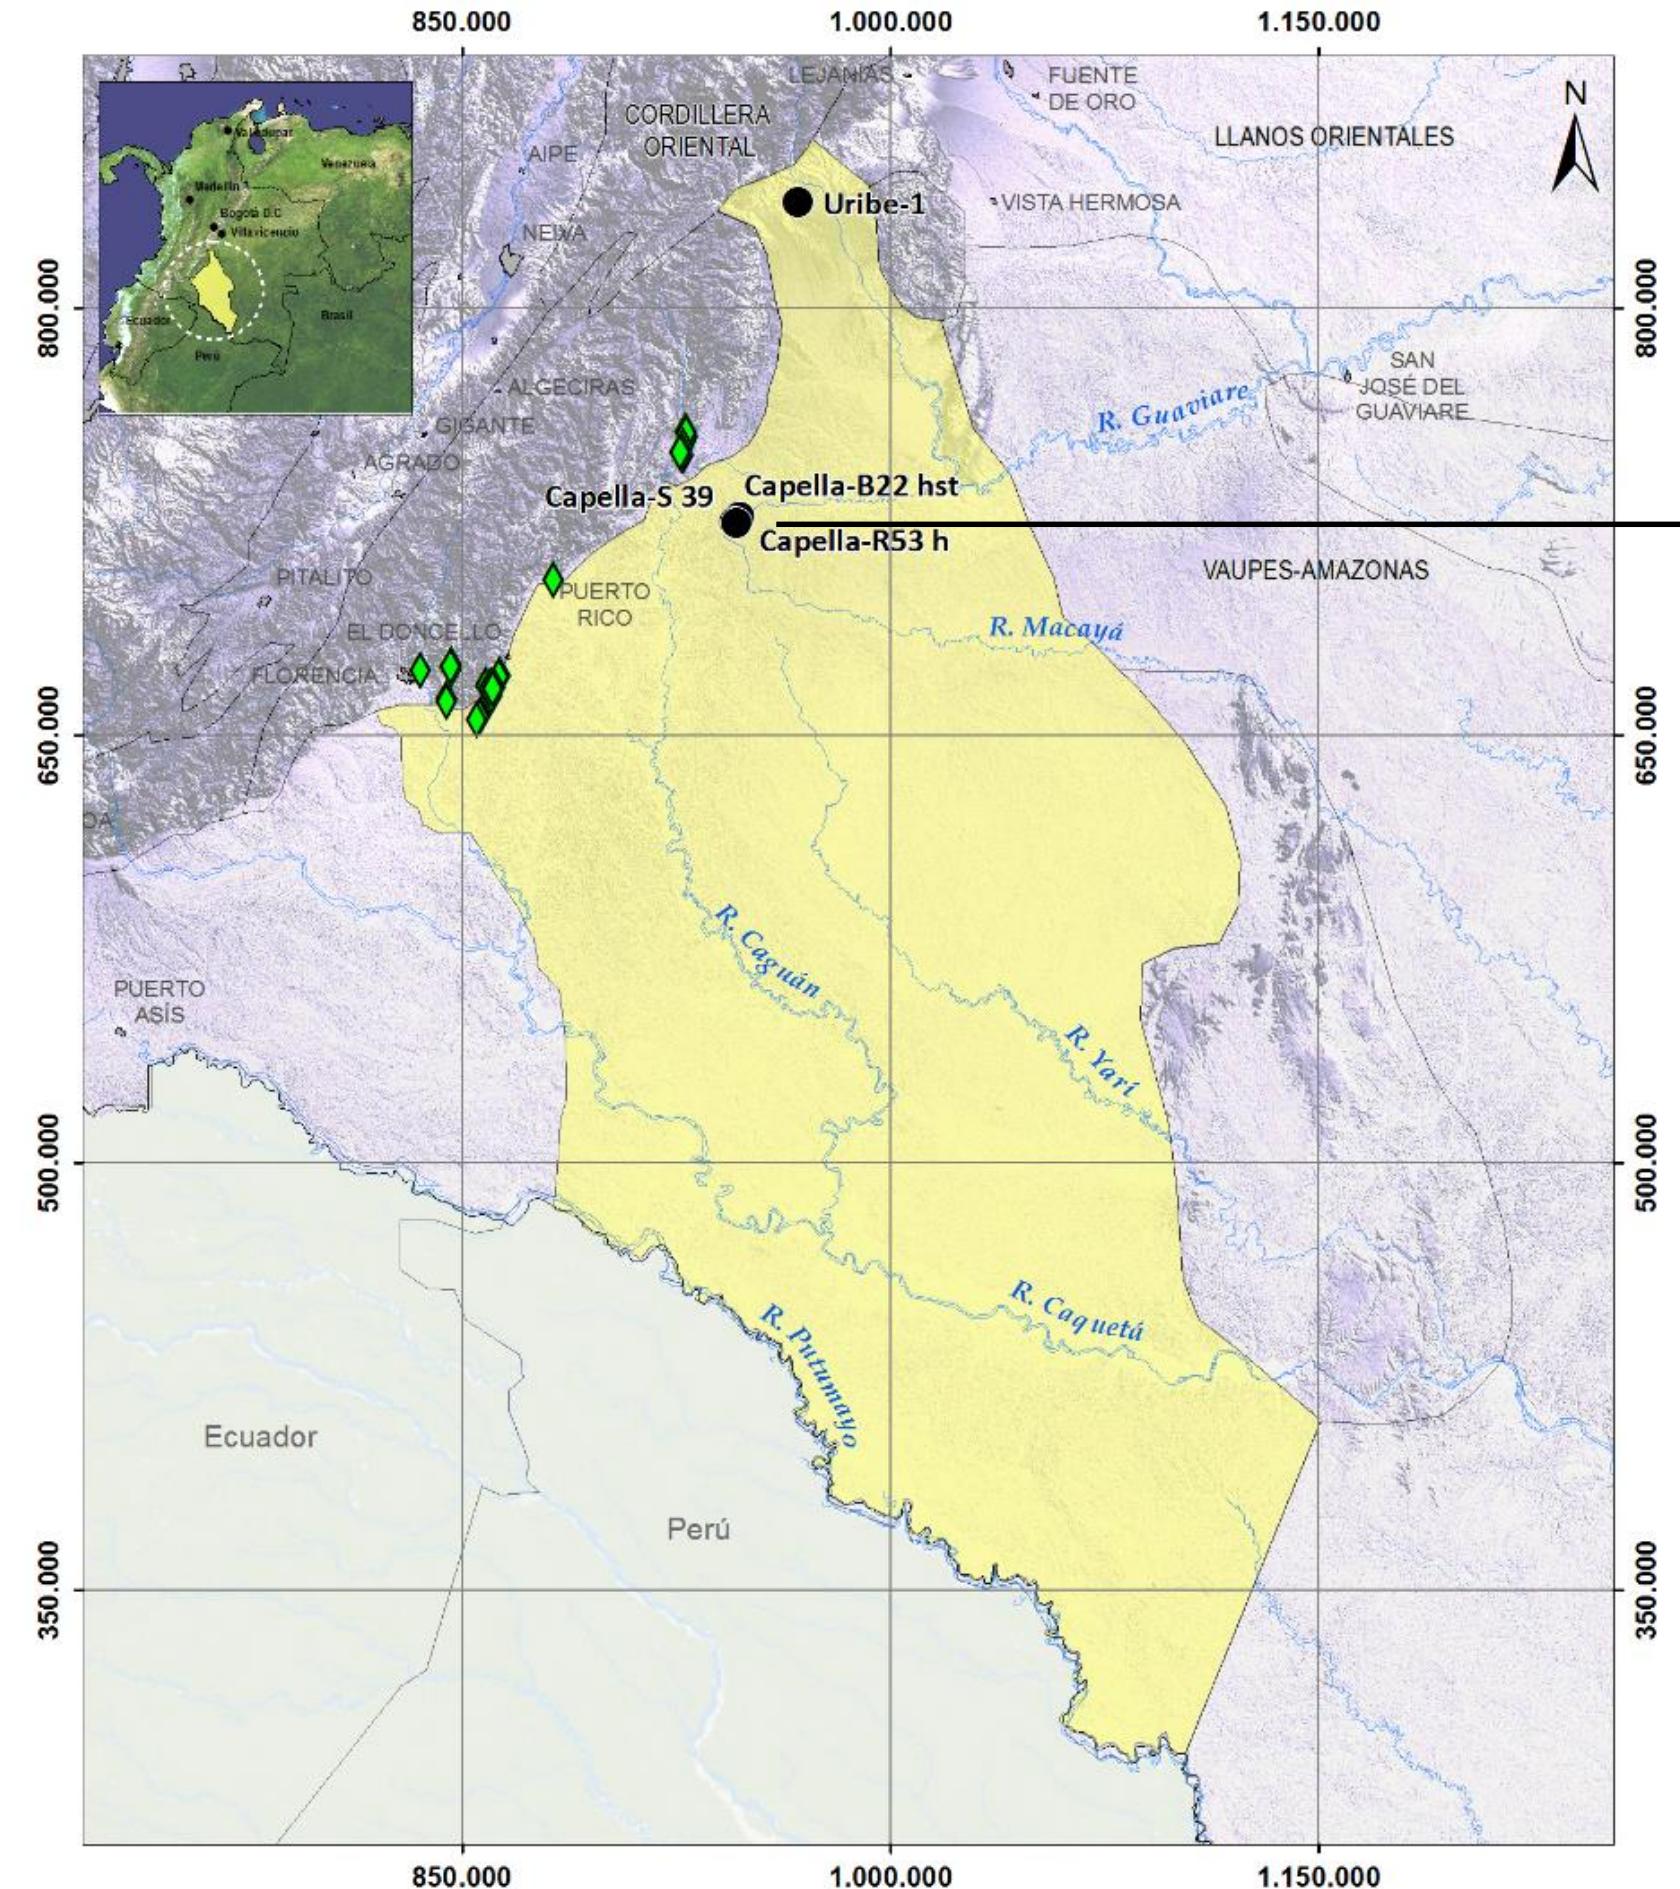

- The **basin deformation is low**, focused on the areas close to the Eastern Cordillera
- There is a strip of **inverse faults in the Northeast** part of the basin, where the Capella field was discovered
- Stratigraphic play** along the depositional limit of Mirador Fm, represents a major **underexplored** play that is extended to the Putumayo Basin

Final Comments

- The Caguán Sub Basin as a Frontier Basin with oil production (Capella field) is a **great opportunity for visionaries**.
- Update and review confidentiality of the information to **increase the volume of data available** for this type of study, making the results more attractive to the Industry.
- Similar to USA, Canada, England and recently in Brazil, the seismic information, wells, surface geology, etc., could be **made public one year after being obtained**. It would be very useful for operators, investors and strategies of the ANH and the SGC.
- More volume and availability of geological and geophysical information stimulates **additional studies related to groundwater, minerals, infrastructure, construction, etc.**

Thanks
