2022 ANH TECHNICAL TALKS

Seismic reprocessing highlights and implications
in the Sinu San Jacinto basins onshore Colombia

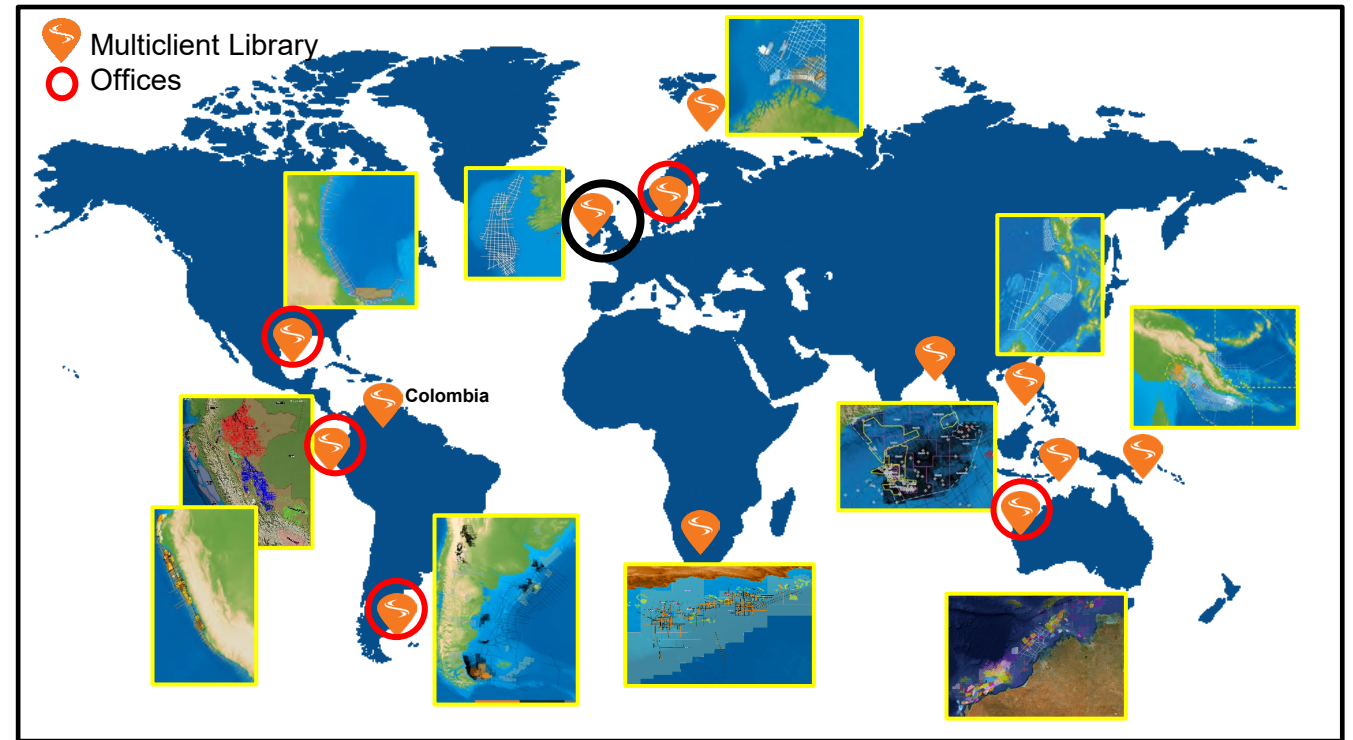

KARYNE RODRÍGUEZ

FRIDAY, OCTOBER 21ST 2022 8:00 a.m. — 9:00 a.m.

Searcher Introduction

Largest privately-owned multi-client company in the world

Acquisition

Processing

Data Integration

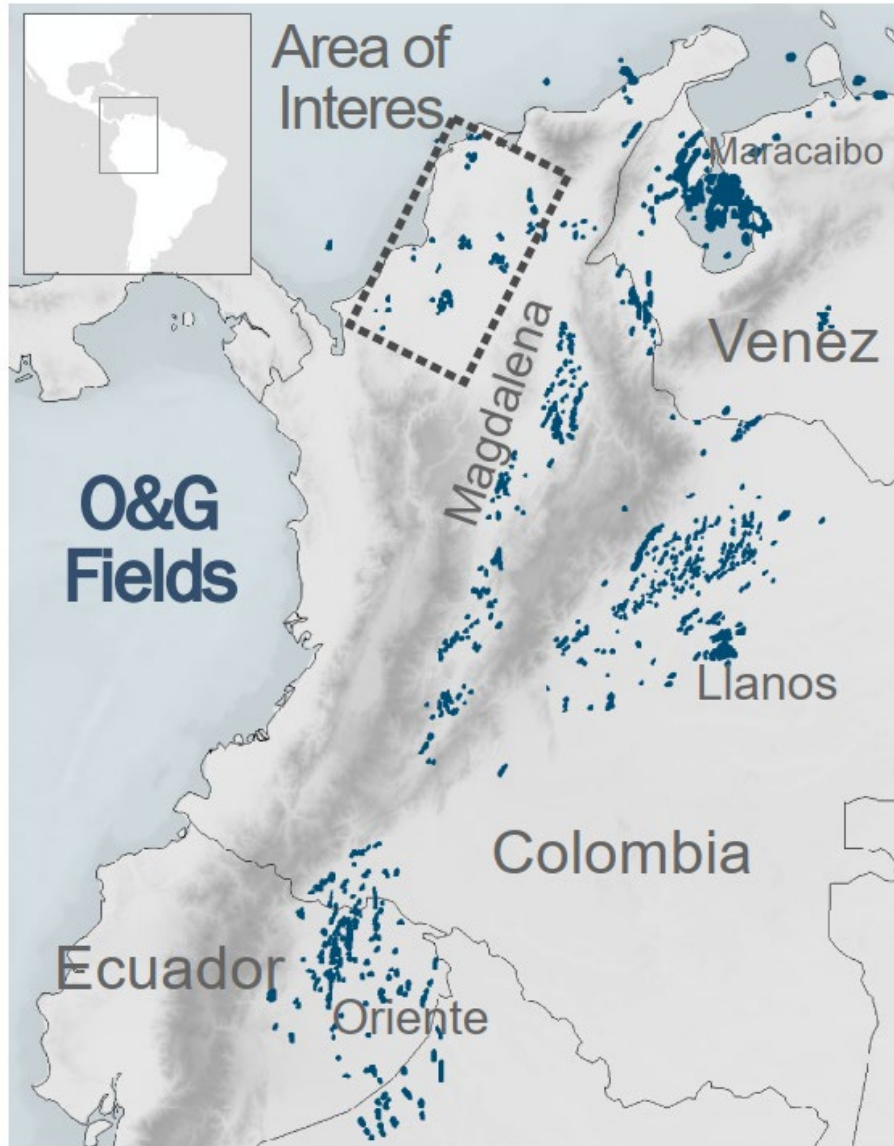

Technology

> 1,200,000 km 2D
 > 350,000 sqkm 3D

Most suitable vessel and processing company

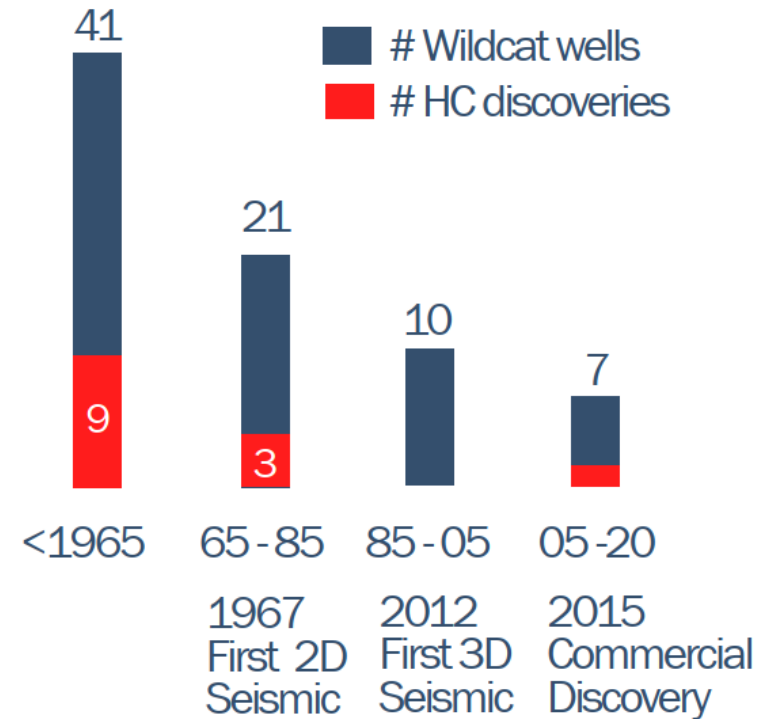

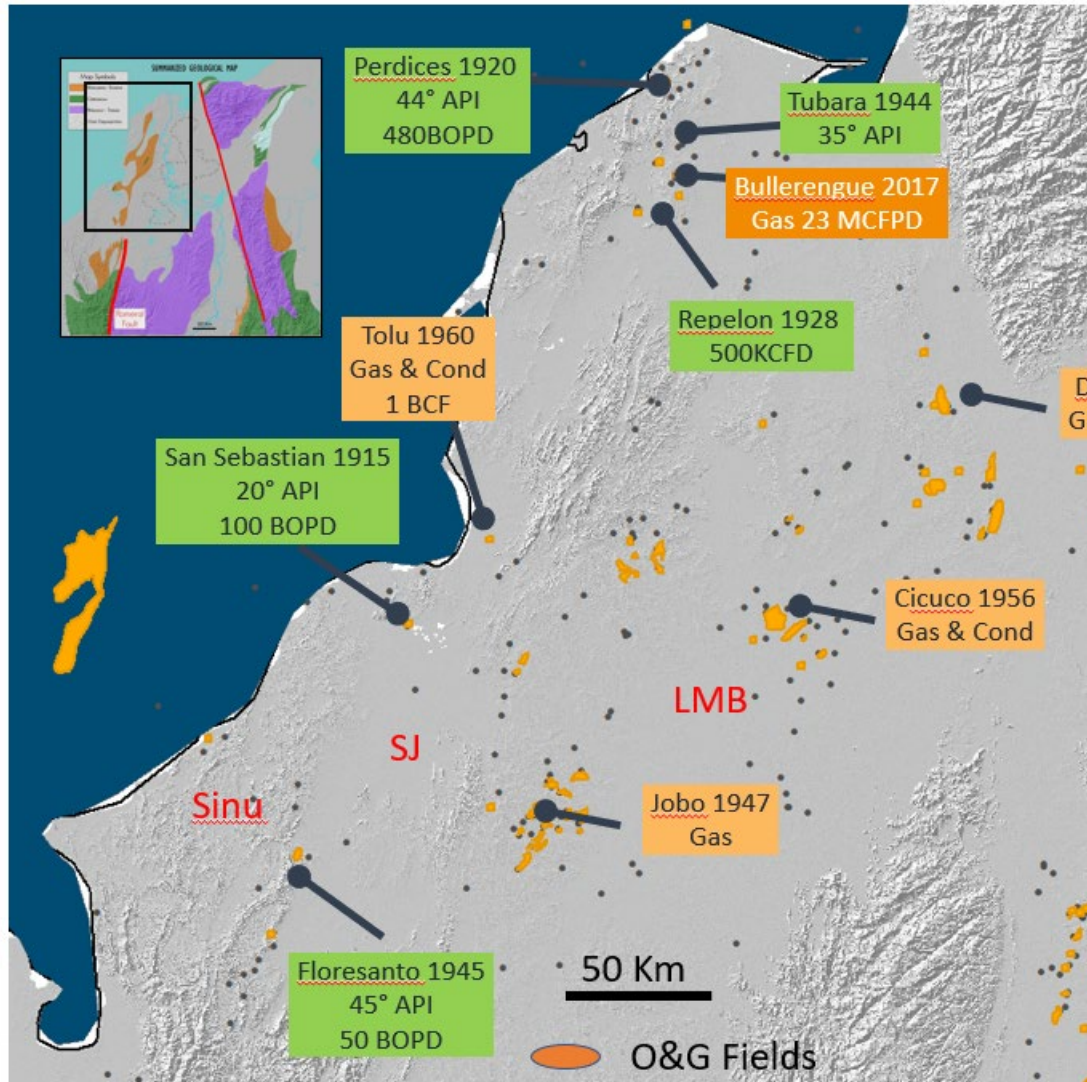

Cesar Mora talk Oct 2022 remarks

- LMB 3.57 TCF reserves discovered
- Most significant gas reserves additions in the last 10 years came from LMB
- Ranked 2nd gas producer basin in Colombia

Exploration History

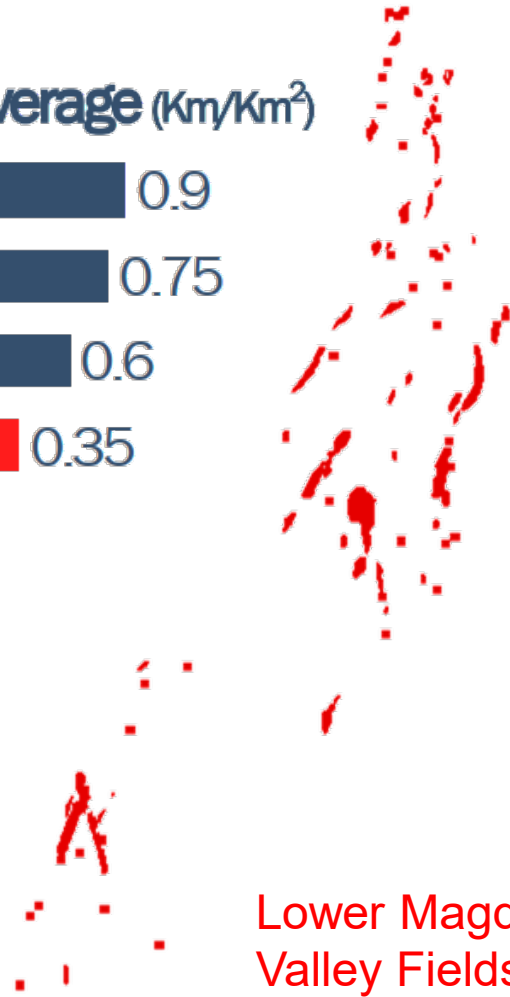

Despite HC indications, limited exploration has been done in Sinu-San Jacinto

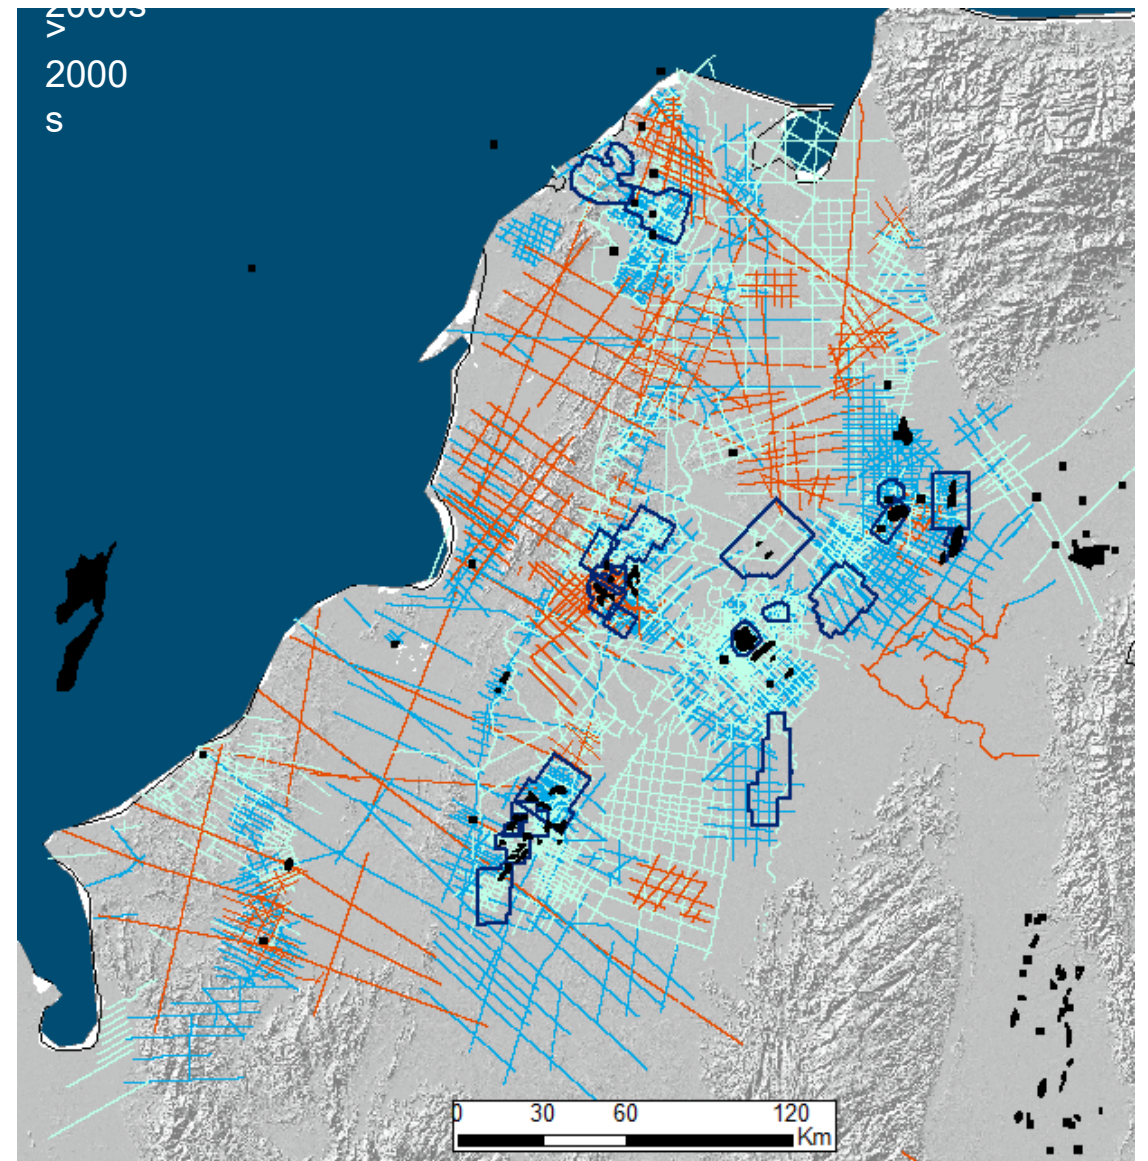

2D Seismic Coverage

2D Seismic coverage (Kmy/Km²)

| | | |
|-------------------|---|------|
| Middle Mag |  | 0.9 |
| Llanos |  | 0.75 |
| Lower Mag |  | 0.6 |
| Sinu - S. Jacinto |  | 0.35 |

Lower Magdalena

Regional Stratigraphy

Older reservoirs have been proven to be effective recently by commercial discoveries from Hocol in the North of San Jacinto

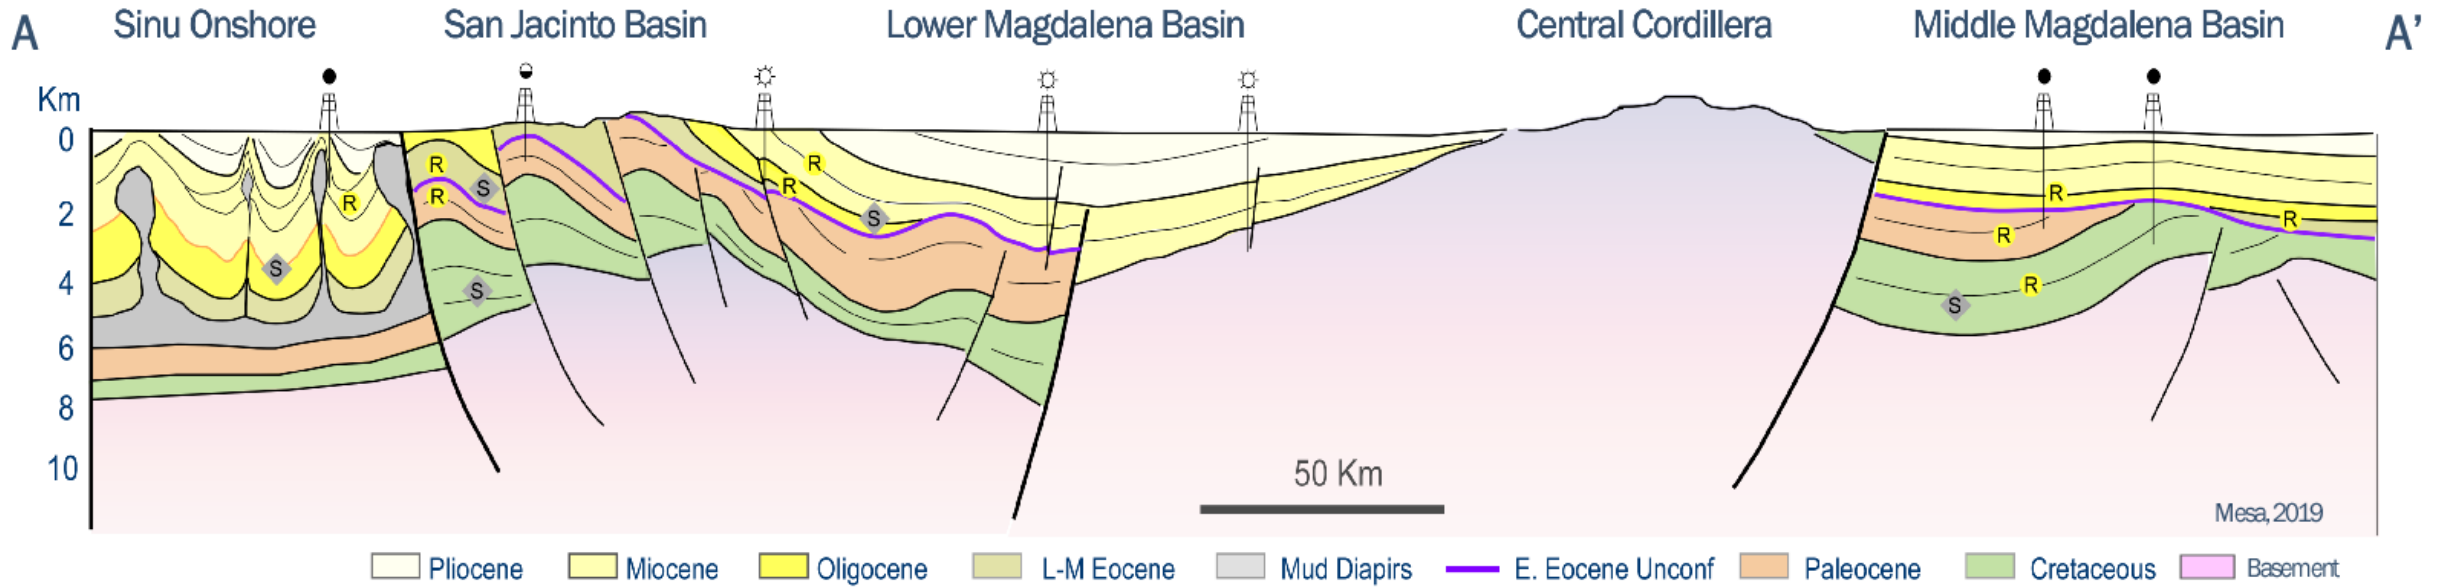

Even though there are potential similarities in the evolution of oil prolific basins to the East, there are still question marks to be solved by the industry and academia

Miocene Basin Floor Fans Potential

From Mora, et al. 2018

Geologic Cross Section

High structural complexity in the region have a significant impact on the subsurface image, which impacts the appetite for more exploration

SEISMIC PROCESSING

1. Post stack rectification

- a) Merged
- b) Time, amplitude and phase corrected
- c) Result : Regional dataset**

2. Pre stack reprocessing

- a) Data reprocessed from field
- b) tapes
- c) Using modern and suitable algorithms
- d) Result: Improved seismic image**

- Data Collection and Review
- QC Lines
- QC Shot Annotation
- **Geometry Correction**
- Standardise EBCDIC
- AGC
- Time, Phase and Amplitude Matching
- Reporting
- Ingestion To Saismic

Time, Phase, Amplitude, Navigation and Metadata Rectification

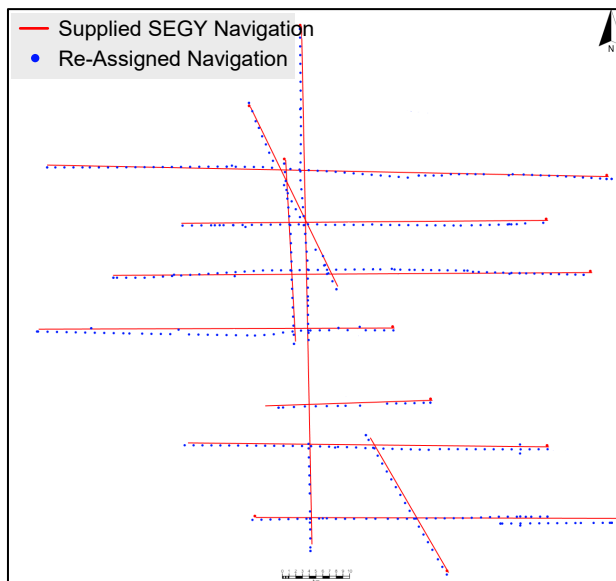

ONSHORE **PERU** RECTIFIED DATA

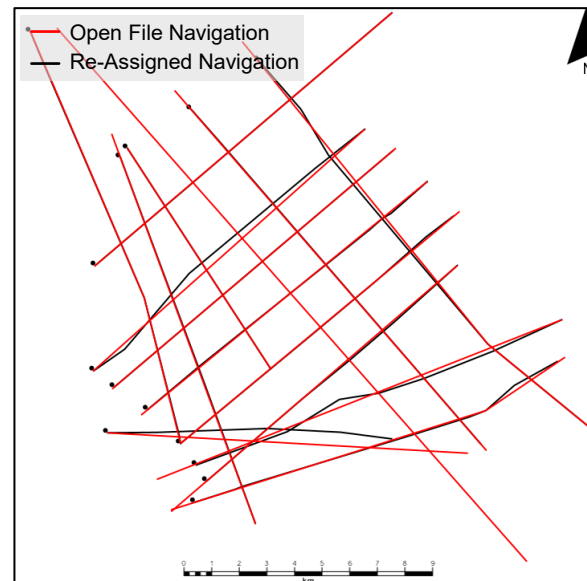

The result of the rectification process is to have a contiguous database that can be easily loaded into any interpretation software. Much-improved, consistent, regional grid covering the onshore basins of Peru, with multiple vintages tying as many wells, leads and prospects as possible.

WORKFLOW: GEOMETRY RECTIFICATION

- This is a critical step in the rectification workflow and each line is carefully examined and inspected prior to use. Lines are often received with wrong projections, incorrect geometry, flipped lines, substantially simplified geometry compared to original navigation or received without geometry. Errors can easily exceed 1km.
- To ensure the most accurate geometry is applied to the rectified seismic, all sources of navigation are compared. Depending upon the data available, navigation sources may include:
 - SEGY headers
 - Supplied navigation text files (e.g. P190, S-Card, C-Card)
 - Shape files

Example SEGY header navigation over-simplified compared to original navigation.

Example open file source navigation position differences compared to rectified dataset

Example projection and datum correction with potential errors >200 m

WORKFLOW: GEOMETRY RECTIFICATION

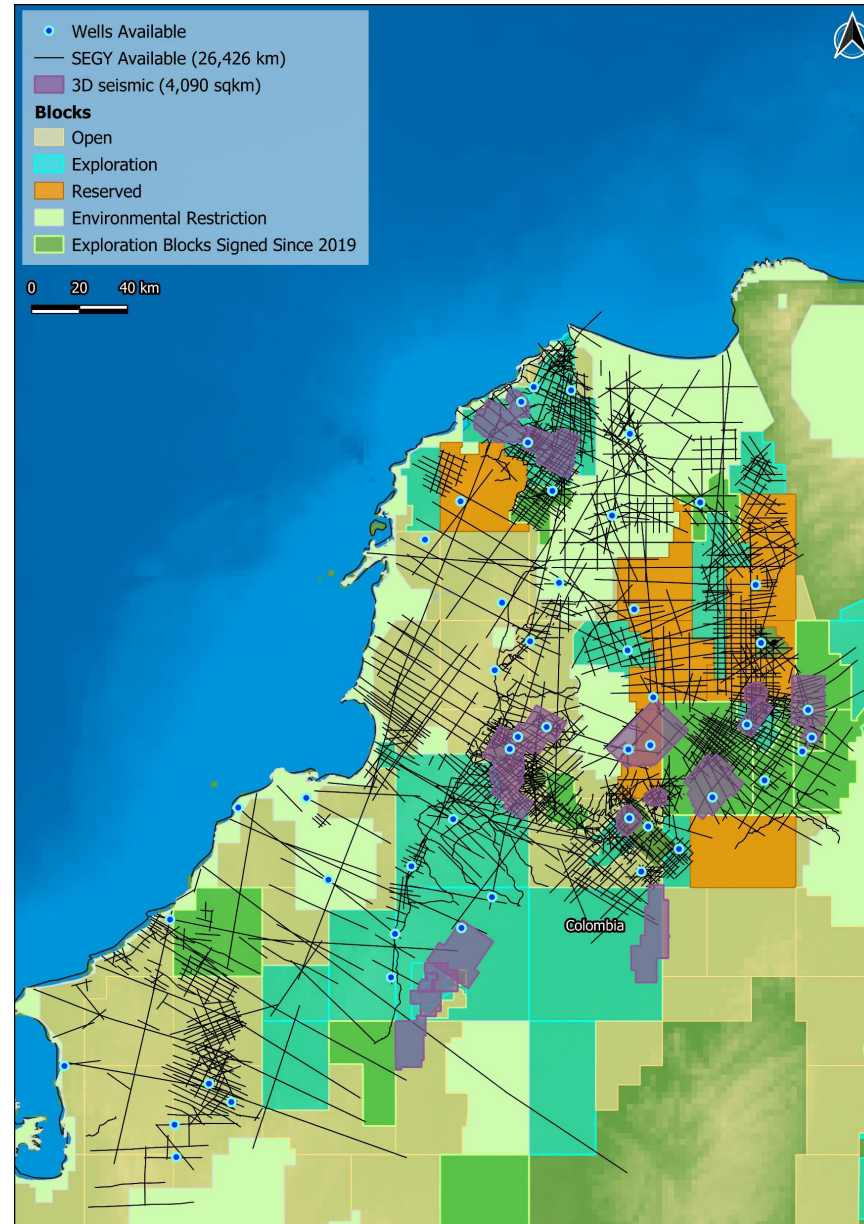

Example of a flipped line:

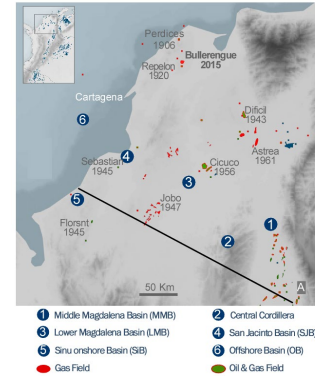

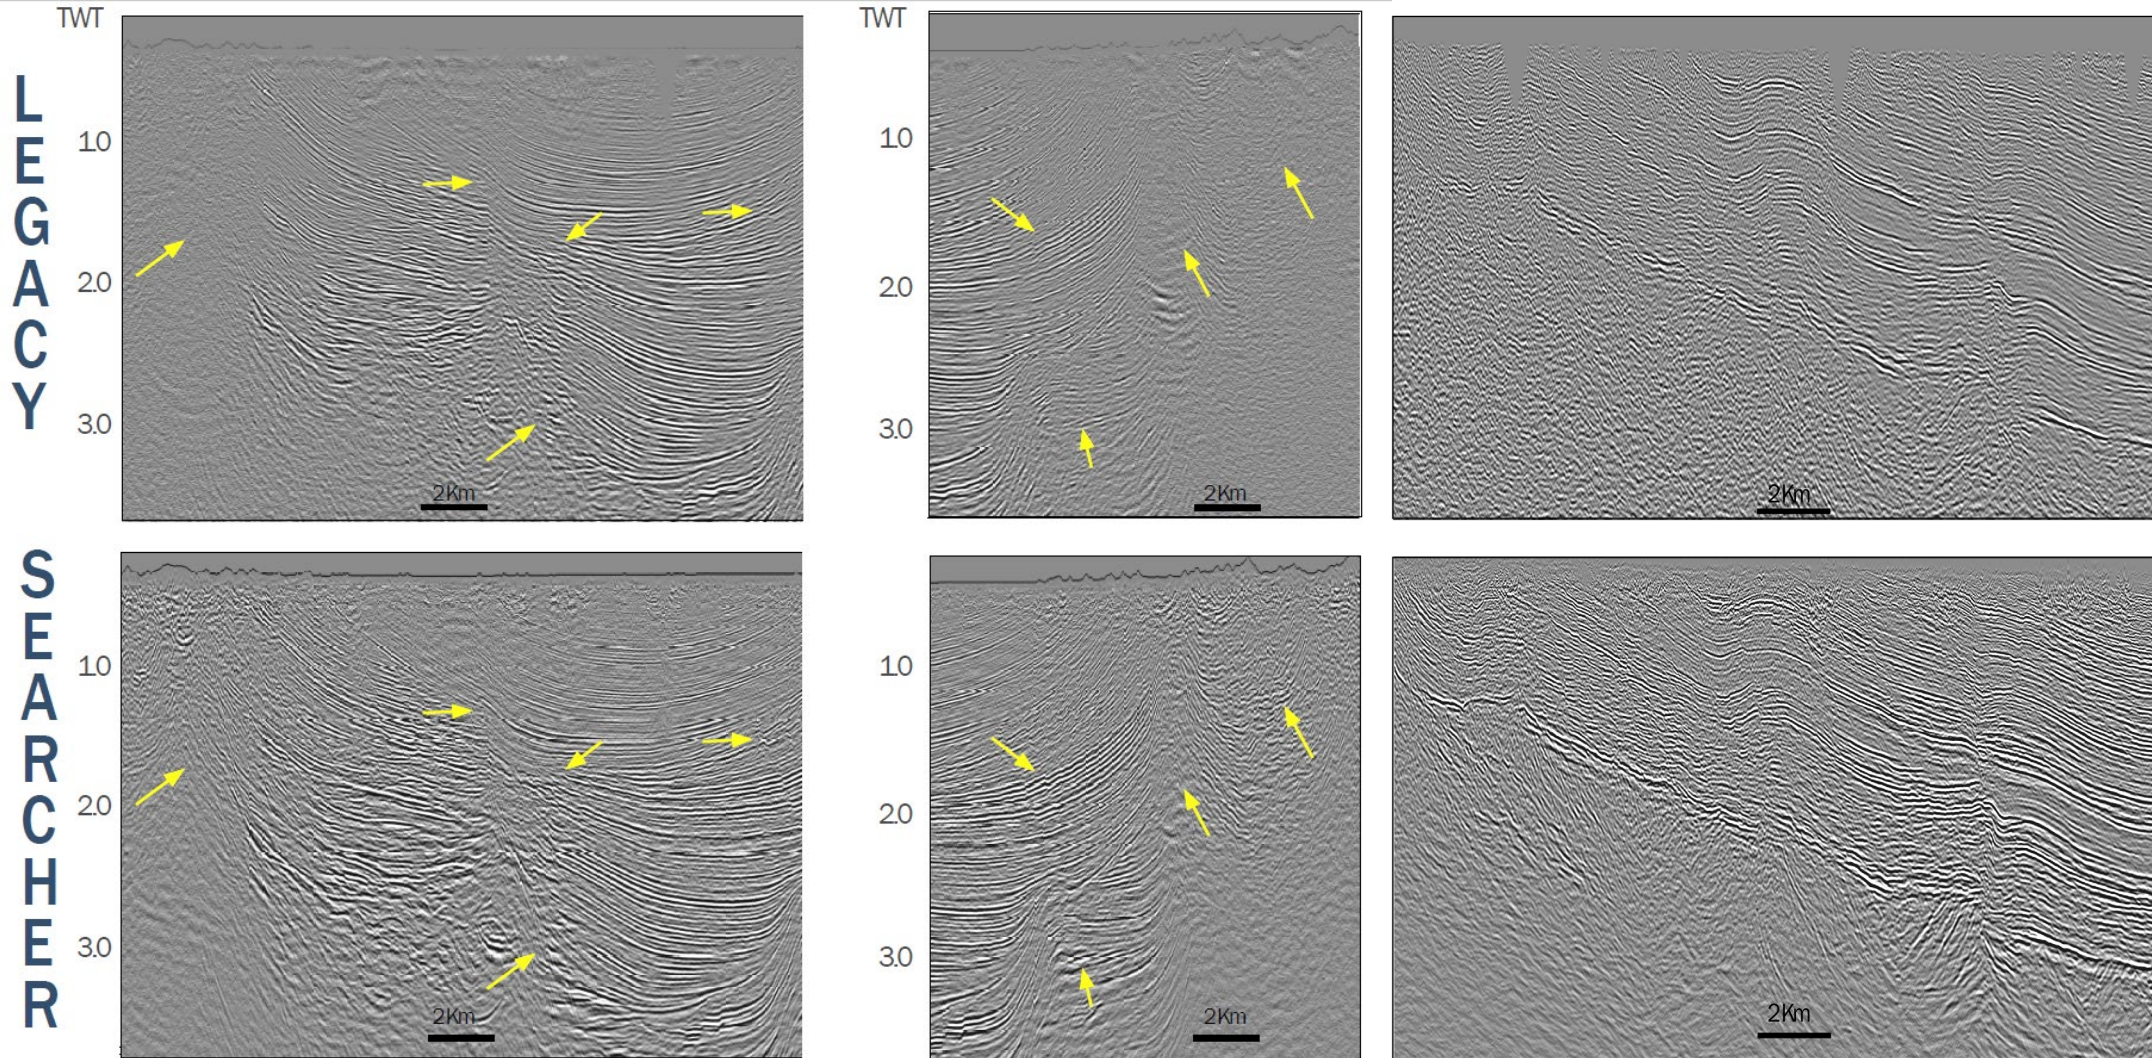

Example of incorrect geometry and projection

Segy Available at SGC – For Rectification

2022 PSDM Reprocessing Image Enhancement Highlights

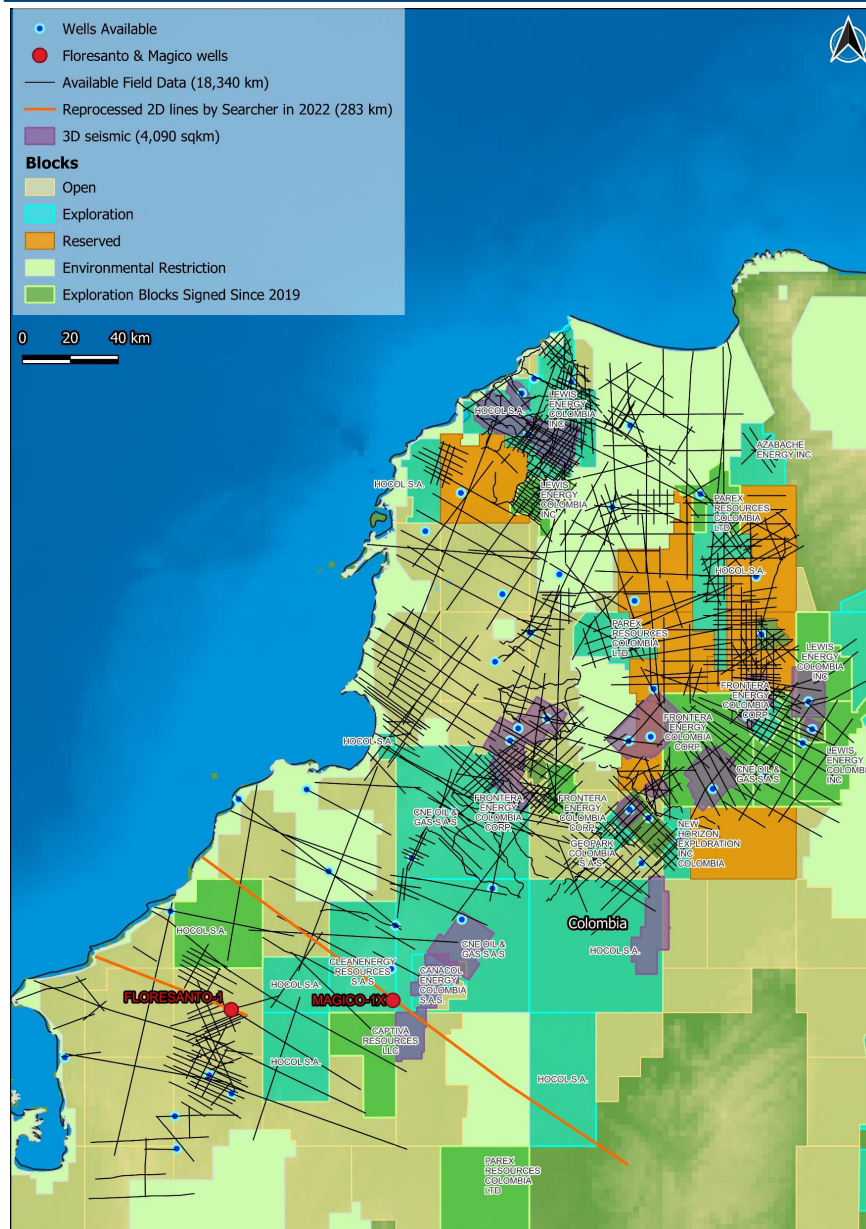

Interval Velocity Overlay

Shale diapir model not supported by high velocities

- Several breakthroughs observed from prestack reprocessing so far
 - Mud diapir model is challenged with high velocities resulting in seismic events
 - Steeply dipping fault plane?
 - Salt cored anticline?
 - Shale cored anticline?
 - Deep imaging confirm Cretaceous section and opens Cretaceous plays
 - Onlapping Oligocene sandstone new play

- Reprocessing all available legacy 2D and 3D seismic in
 - Sinu
 - San Jacinto
 - Lower Magdalena Valley
